

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

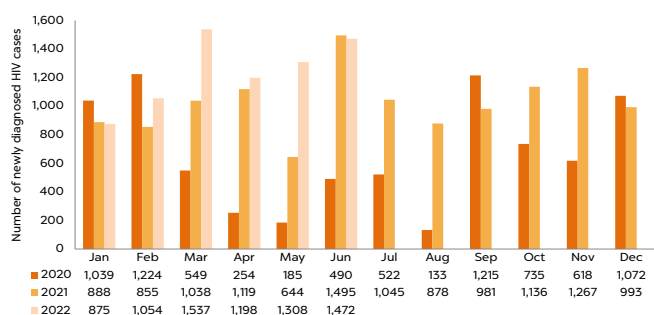

Average number of people newly diagnosed with HIV per day, selected years^a

NEWLY DIAGNOSED CASES

In June 2022, there were 1,472 confirmed HIV-positive individuals reported to the HIV/AIDS & ART Registry of the Philippines (HARP). This was a 2% decrease compared to the same reporting period last year (1,495) [Figure 1]. Twenty-five percent (372) had clinical manifestations of advanced HIV infection^b at the time of testing [Table 1].

Figure 1: Number of newly diagnosed HIV cases per month, 2020-2022

Majority (95%) of the total reported cases in June 2022 were male while 5% (80) were female. The age of the reported cases ranged from 2 to 71 years old (median: 28 years). Further, among newly diagnosed cases, <1% (3) were less than 15 years old, 29% (421) were 15-24 years old, 51% (753) were 25-34 years old, 17% (252) were 35-49, and 3% (43) were 50 years old and older.

Moreover, there were 11 HIV-positive women reported pregnant at the time of diagnosis. The age of reported cases ranged from 18 to 34 years old (median: 27 years).

Table 1: Summary of HIV diagnoses and deaths, Jan 1984-Jun 2022

Demographic Data	Jun 2022	Jan-Jun 2022	Jan 2017-Jun 2022	Jan 1984-Jun 2022 ^c
Total reported cases	1,472	7,444	62,876	101,768
Advanced HIV infection ^b	372	2,131	11,212	14,796
Male	1,392	7,072	59,765	95,881

Age range	2 - 71	1 - 80	1 mo - 80	1 mo - 82
Median age	28	28	28	28
Age groups:				
<15	3	25	193	304
15 - 24	421	2,219	18,893	29,472
25 - 34	753	3,699	31,560	51,560
35 - 49	252	1,319	10,626	17,707
50 & older	43	182	1,604	2,653
Reported pregnant ^d	11	63	519	673
Reported deaths ^e	36	246	3,698	5,616

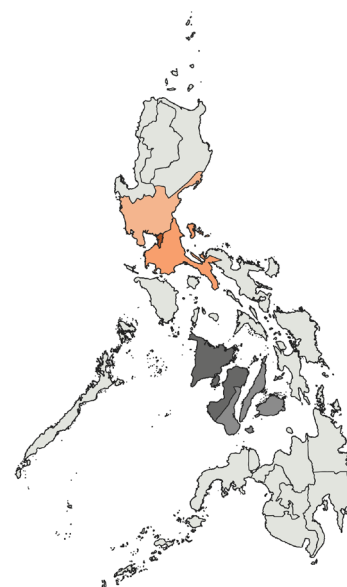

Sexual contact remained to be the predominant mode of transmission (97%) while transmission through sharing of infected needles accounted for 1% (15), and less than 1% (2) were children who acquired HIV through mother-to-child transmission. Among the newly reported cases who acquired HIV through sexual contact, 67% (960) were through male to male sex, 21% (302) through males who have sex with both males and females^f, and 12% (167) through male to female sex.

^a Computation was based on the cumulative cases (7,444) of the reporting year, June 2022
^b Advanced HIV Disease (AHD) definition is based on clinical criteria of WHO staging 3 and 4 while immunologic criterion is based on baseline CD4 results
^c No data on sex for 11 cases and age for 72 cases
^d Pregnant at the time of diagnosis
^e Reported deaths due to any cause and not necessarily AIDS-related
^f Among males only

More than half (51%, 754) of the total cases reported were from the National Capital Region [NCR] and surrounding regions of CaLaBaRZon [4A] and Central Luzon [3] [Figure 2].

Anti-retroviral Therapy

In June 2022, there were 1,149 people living with HIV (PLHIV) who were newly enrolled on ART [Figure 3], 1,148 were on the first line regimen and one was on the second line regimen. Among them, <1% (5) were less than 15 years old, 31% (360) were 15-24 years old, 48% (550) were 25-34 years old, 18% (208) were 35-49 years old, and 2% (26) were 50 years old and older. The median CD4 of these patients upon enrollment was at 220 cells/mm³.

Among the total PLHIV enrolled on ART, 96% (60,144) were males and 4% (2,313) were females. The proportion of males enrolled to ART was significantly higher compared to females, a trend which was also observed among those diagnosed. The age of PLHIV on ART ranged from 1 to 80 years old (median: 32 years). Ninety-six percent were on the first line regimen, 3% were on the second line, and 1% were on the third line of regimen.

Figure 3: Number of ART initiation per month, 2020-2022

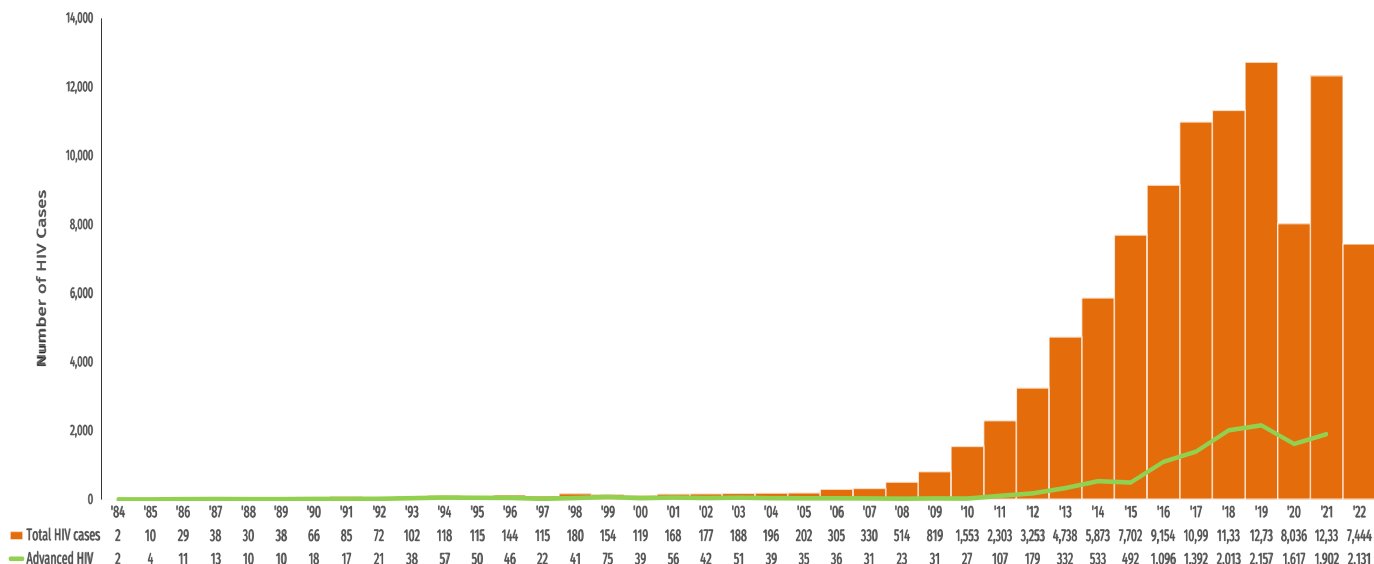

Note:
 Due to reporting delay/no submissions, data from previous month (May 2022) were used for General Santos City Social Hygiene Clinic and Zamboanga Del Sur Medical Center in updating their treatment outcome for this reporting period.

EPIDEMIC TRENDS OF HIV/AIDS IN THE PHILIPPINES, JAN 1984 - JUN 2022

Since the first reported HIV infection in the Philippines in 1984, there have been 101,768 confirmed HIV cases reported to the HARP [Figure 4]. Ninety-four percent (95,881) of those diagnosed were male^a and 6% (5,876) were female^a. At the time of diagnosis, more than half (51%, 51,560) were 25–34 years old^b while 29% (29,472) were among youth (15–24 years old^b). The age of diagnosed ranged from one month to 82 years old (median: 28 years). Fifteen percent (14,796)ⁱ of the reported cases had advanced clinical manifestation at the time of testing [Figure 4]. There was a 23% increase in diagnosed cases in January to June 2022 (7,444) compared to the reported cases in the same period last year, January to June 2021 (6,039) [Figure 4].

Figure 4: Number of diagnosed HIV cases and advanced infections reported in the Philippines by year, Jan 1984–Jun 2022 (N=101,768)

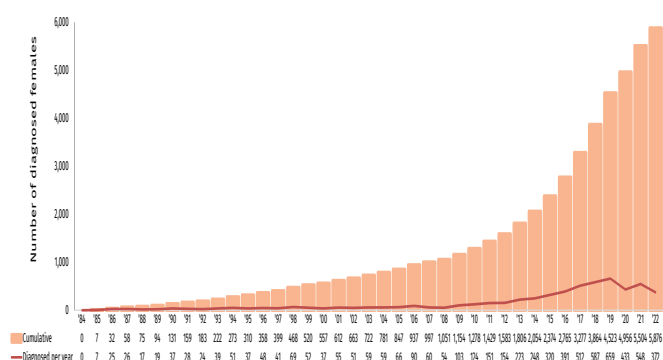

Sex and Age

Ninety-two percent of the total reported cases (93,956 of 101,768) were reported in the past 10 years, thus the significant increase among males and females and across all age groups when compared to the previous 10-year period (2002 - 2011).

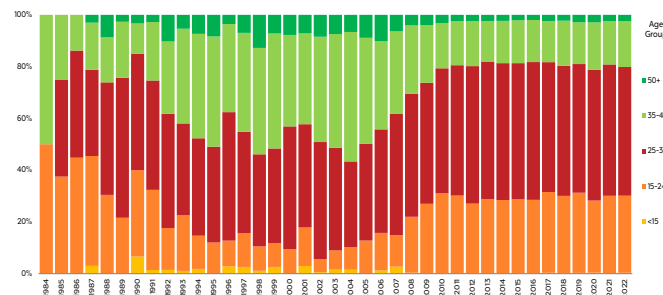

Overall, cases have increased among males and females. Ninety-three percent (89,149) of the total cases among males and 76% (4,447) of the total cases among females were reported in the past 10 years [Figure 5].

Figure 5: Number of diagnosed female HIV cases by year, Jan 1984 - Jun 2022 (n=5,876)

Among age groups, the highest increase in the proportion of cases from 2012 - 2022 were among 25 - 34 years old followed by those aged 15 - 24 years old. Consequently, more than 90% of the total reported cases among these age groups - 94% (27,759) of total cases among 15 - 24 years old and 93% (47,838) among 25 - 34 years old were reported in the past 10 years [Figure 6]. Meanwhile, among all female cases since 1984, 92% (5,430) were in the reproductive age group (15–49 years old) at the time of diagnosis.

Figure 6: Proportion of diagnosed HIV cases by age group, Jan 1984 - Jun 2022

Geographic Distribution

From January 1984 to June 2022, the regions with the most number of reported cases were NCR, followed by 4A, 3, Central Visayas [7], and Western Visayas [6], altogether accounting for 76% (77,439) of the total reported cases. Further, 23% (22,237) were from the rest of the country while 1% (1,092) had no data on region of residence [Table 2].

Table 2: Number of diagnosed HIV cases by region of residence, Jan 1984 - Jun 2022

Region	Jun 2022 (n=1,472)	Jan-Jun 2022 (n=7,444)	Jan 2017-Jun 2022 (n=62,876)	Jan 1984-Jun 2022 (N=101,768) ^j
NCR	318 (22%)	2,021 (27%)	19,761 (32%)	36,347 (36%)

^a No data on sex for 11 cases
^b No data on age for 72 cases
ⁱ Advanced HIV Disease (AHD) definition is based on clinical criteria of WHO staging 3 and 4 while immunologic criterion is based on baseline CD4 results
^j No data on region of residence for 1,092 (1%) cases

Mode of Transmission (MOT)

As of June 2022, sexual contact among males who have sex with males (MSM) (82%, 83,099) was the predominant MOT among the total reported cases, followed by male-female sex (14%, 14,678), and sharing of infected needles (2%, 2,452). More than half of MSM (52% , 43,265) were 25-34 years old at the time of diagnosis, and 31% (25,710) were 15-24 years old. Among diagnosed females, male-female sex was the most common MOT (93%, 5,470) followed by sharing of infected needles (3%, 146) [Table 3].

Among those who were reported to have acquired HIV through mother-to-child transmission, 256 were children less than 10 years old and nine were adolescents aged 10-19 years old^k.

From 1984 to 2006, the predominant MOT was sexual contact between male and female, however, in 2007, the trend shifted to sexual contact among MSM and remained as such up to the present. Further, while the proportion of transmission through sharing of infected needles increased in 2010 with 9% (147) of the total cases (1,553) reported among people who inject drugs (PWID), it has decreased to 1% among newly diagnosed cases in the past five years.

Regional patterns vary across different MOT – 38% (31,419) of diagnosed males who have sex with males were from NCR; more than half of those who have acquired HIV

through mother-to-child transmission were from NCR, 4A, and 3 (56%, 150); and almost all (>99%, 2,445) reported cases among people who inject drugs were from Region 7.

Table 3: Number of diagnosed HIV cases by mode of transmission and sex^l, Jan 1984 - Jun 2022

Mode of Transmission	Jun 2022 (n=1,472)		Jan-Jun 2022 (n=7,444)		Jan 2017-Jun 2022 (n=62,876)		Jan 1984-Jun 2022 (N=101,768) ^m

SPECIFIC POPULATION

Youth (15-24 years old)

In June 2022, 29% (421) cases were youth aged 15-24 years old, among which 96% were male. Ninety-nine percent (418) cases were infected through sexual contact (33 male-female sex, 316 male-male sex, 69 sex with both males & femalesⁿ), while three cases had no data on MOT.

From January 1984 to June 2022, 29% (29,472) of the reported cases were 15-24 years old, of which, 63% (18,893) were reported in the past five years. Ninety-seven percent (28,729) were infected through sexual contact (3,019 male-female sex, 18,113 male-male sex, 7,597 sex with both males & femalesⁿ), 2% (468) were infected through sharing of infected needles, less than one percent (1) was infected through mother-to-child transmission, and one percent (274) had no data on MOT [Figure 7]. More males were diagnosed from this age group since 2004, however, the number of diagnosed HIV cases among female youth had increased in the past five years. Compared with the same reporting period (77) last year, there was a 44% increase in newly diagnosed females aged 15-24 years old from January to June 2022 (111).

Figure 7: MOT among youth, Jan 1984-Jun 2022 (n=29,472)

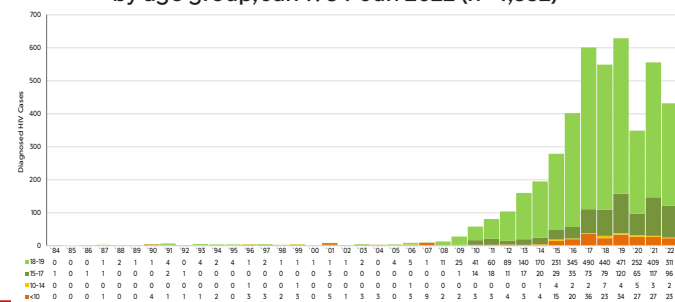

Children (<10) & Adolescents (10-19)

In June 2022, there were 85 newly reported cases aged 19 and below, of which, 82 were adolescents aged 10 - 19 years old and three were children less than 10 years old. Among the adolescents, 20% (16) were 15-17 years old, and 80% (66) were 18-19 years old. Further, 98% of adolescents were infected through unprotected sexual contact (five male-female sex, 62 male-male sex, and 13 sex with both males & femalesⁿ), and two have no data on MOT. On the other hand, of the newly diagnosed children, two were acquired through mother-to-child transmission and one has no data on MOT.

Four percent (4,532) of all diagnosed cases from January 1984 to June 2022 were 19 years old or younger at the time of diagnosis, of which, 6% (271) were less than 10 years old, 1% (33) were 10-14 years old, 15% (704) were 15-17 years old, and 78% (3,524) were 18-19 years old [Figure 8].

Following the ratification of the Philippine HIV and AIDS Policy Act (RA 11166) where the age for HIV testing without the need for consent from parent or guardian was lowered to 15 years, the number of reported cases among 15-17 years old has increased by 30% from 2019-2022 compared to 306 total cases reported aged 15 - 17 years old before the ratification in 2018. Among newly reported cases from 2019 - 2022 (40,551), 1% (398) were among those aged 15 - 17 years old and 4% (1,443) were aged 18 - 19 years old.

^k Age was based at the time of diagnosis
^l Sex at birth; M=Male, F=Female
^m No data on MOT and sex for 11 cases
ⁿ Among males only

Transgender Women (TGW)

Reporting of gender identity was included in the HARP starting year 2018. Of the total reported cases for June 2022, 58% (847) were cisgender^o, 2% (33) were transgender women, <1% (3) identified their gender neither as man or a woman, and 38% (561) have unknown/no data on gender identity. Among the transgender women, 42% (14) were 25–34 years old, 27% (9) 15–24 years old, 24% (8) were 35–49 years old, and 6% (2) were 50 years old and older. The age of diagnosis ranged from 16 to 55 years old (median: 32).

A total of 1,353 TGW were diagnosed from January 2018 to June 2022. Almost all (99%, 1,341) of the cases transmitted through sexual contact was less than 1% (3) through sharing of infected needles. Nine (1%) TGW had no data on MOT.

Further, half (50%, 671) of the TGW were 25–34 years old at the time of testing, 28% (385) were 15–24 years old, 20% (265) were 35–49 years old, and 2% (32) were 50 years and older [Figure 9]. The age of diagnosis ranged from 15 to 63 years old (median: 28).

Transactional Sex

People who engage in transactional sex are those who reported that they either pay for sex, regularly accept payment for sex, or do both. Reporting of transactional sex was included in the HARP starting December 2012.

In June 2022, 8% (113) of the newly diagnosed engaged in transactional sex within the past 12 months [Table 4]. Ninety-seven percent (110) were male. Their age ranged from 17 to 61 years old (median: 31). More than half (56%, 62) of the males reported paying for sex only, 30% (33) reported accepting payment for sex only, and 14% (15) engaged in both. Three females who engaged in transactional sex were diagnosed in this reporting period. One each were paying for sex, accepting payment for sex and engaged in both.

A total of 10,860^a cases reported to HARP from December 2012 to June 2022 were people who engaged in transactional sex. Ninety-seven percent (10,519) were male. There were 53% (5,797) who paid for sex, 32% (3,432) who accepted payment for sex, and 15% (1,631) who engaged in both [Table 4].

Overseas Filipino Workers (OFW)

Seventy-two Filipinos who worked overseas within the past five years, whether on land or at sea, were newly reported in June 2022. They comprised 5% of the total cases for this period. Of these, 87% (63) were male. Further, 95% (60) of the male cases acquired HIV through sexual contact (11 male-female sex, 36 male-male sex, and 13 sex with both males and females^d). Three cases were reported to have no data on mode of transmission. The age of male OFWs ranged from 25 to 51 years old (median: 33 year old). Fifty-eight percent (37) of the male cases were 25–34 years old, 37% (23) were 35–49 years old, and 5% (3) 50 years & older at the time of testing. There was no reported case from the 15–24 years old age group. Eighty-nine percent (8) female OFWs were infected through sexual contact and one case had no data of MOT. The age of female OFWs ranged from 26 to 55 years old (median: 38).

From January 1984 to June 2022, 9% (8,711) of the total cases were OFWs [Figure 10]. Of these, 88% (7,646) were male. Almost all (98%, 7,523) of male cases were infected through sexual contact (1,745 male-female sex, 3,470 male-male sex and 2,308 sex with both males and females^d). The ages of male OFWs ranged from 16 to 80 years old (median: 32).

^oCisgender means having a self identity that correspond to their sex assigned at birth (Man for males; Woman for females)

Figure 10: Cumulative number of diagnosed cases among OFW, Jan 1984–Jun 2022 (n=8,711)

Among 12% (1,065) female OFWs, 97% (1,037) were infected through sexual contact. The age of female OFWs ranged from 20 to 73 years old (median: 35).

The regions with the most number of OFW reported to HARP were from NCR with 30% (2,651) cases, 4A with 18% (1,570) cases, and 3 with 13% (1,106) cases. Further, 36% (3,119) cases were from other regions and 3% (265) had no data on region of residence.

^a Cumulative number of cases reported regardless of the time when the person engaged in transactional sex. Reporting of specific time period when the person last engaged in transactional sex started only in 2017 (FORM version of 2017).
^d Among males only

Pregnant Women with HIV

Reporting of pregnancy status at the time of diagnosis was included in HARP since 2011 and there was an observed increase in the number of diagnosed pregnant women in the past 10 years.

From January to June 2022, there were 63 HIV positive reported pregnant at the time of diagnosis. This was a 39% increase compared to the same reporting period last year (38). Of the reported pregnant women with HIV from January to June 2022, 41% (26) were from NCR, 17% (11) were reported from 4A, 11% (7) were from 3, 8% (5) were from 7, three cases each were from Ilocos Region [1] and CARAGA; two cases each were from MiMaRoPa [4B] and 6; and one case each were from Davao Region [11], Bicol Region [5], Eastern Visayas [8] and CAR.

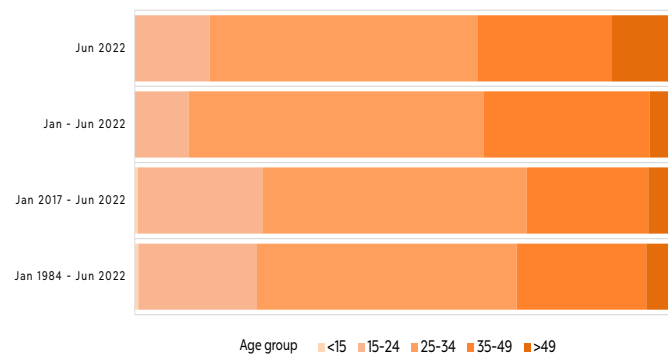

The age of diagnosis ranged from 16 to 38 years old (median: 25). Since 2011, a total of 673 diagnosed women was reported pregnant at the time of diagnosis. The regions with highest number of diagnosed pregnant cases with HIV were NCR (43%, 290), 7 (16%, 110), 4A (14%, 91), 3 (10%, 67), and Region 11 (3%, 23).

Mortality

In June 2022, there were 36^s reported deaths due to any cause among people with HIV, of which, 94% (34) were males. Fourteen percent (5) were 15-24 years old, 50% (18) were 25-34 years old, 25% (9) were 35-49 years old and 11% (4) were 50 years and older [Figure 12]. Fifty-three percent (19) of the newly reported deaths were from NCR and 3 [Table 5].

A total of 5,616 deaths were reported from January 1984 to June 2022 and 92% (5,194) were male. Among different age groups, the largest proportion of reported deaths were among the 25-34 years old accounting for 48% (2,719) of total deaths reported [Figure 12] followed by 35-49 years old with 24% (1,358), 15-24 years old with 22% (1,242), 50 years old and older with 5% (257), and <15 years old with 1% (37). Compared to the previous 5-year period, there was an observed increase in the number of reported deaths among age groups except for those below 15 and 50 years and older. Meanwhile, the top 5 regions with the most number of reported deaths were NCR, 4A, 3, 6, and 7 [Table 5].

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

The HARP is the official record of total number of diagnoses (laboratory-confirmed), ART outcome status and deaths among people with HIV in the Philippines. All individuals in the registry are confirmed by the San Lazaro Hospital STD/AIDS Cooperative Central Laboratory (SACCL) which is the HIV/AIDS National Reference Laboratory (NRL) and DOH Certified Rapid HIV Diagnostic Algorithm - RHIVda Confirmatory Laboratories (CrCLs). Confirmed HIV positive individuals were reported to the DOH-Epidemiology Bureau (EB) and recorded to HARP. ART figures are counts of HIV positive adult and pediatric patients currently enrolled and accessing Antiretroviral (ARV) medication during the reporting period in 170 treatment hubs and primary HIV care treatment facilities that had reported in the HARP. This report did not include patients who have previously taken ARV but have died, left the country, have been lost to follow-up and/or opted not to take ARV. Lost to follow-up is considered once a person have failed to visit a treatment facility more than 3 months after the expected date of ARV refill.

HARP is a passive surveillance system. Except for HIV confirmation by the NRL & CrCLs, all other data submitted to the HARP are secondary and cannot be verified. Hence, HARP cannot determine if an individual's reported place of residence is where the person got infected, or where the person lived after being infected, or where the person is presently living. This limitation has major implications on data interpretation. Readers are advised to interpret the data with caution and consider other sources of information before arriving at conclusions.

HIV/AIDS & ART REGISTRY OF THE PHILIPPINES

FACILITIES DESIGNATED AS HIV TREATMENT HUBS/PRIMARY CARE AND CERTIFIED RHIVDA CONFIRMATORY LABORATORIES

Region	Name of Facility	Address	Landline	Mobile
1	Ilocos Training and Regional Medical Center	Parian, San Fernando City, La Union	(072) 6076418 (072) 6079912	-
	Region 1 Medical Center (PINAS - Unit)	Arellano St. Dagupan City, Pangasinan 2400	(075) 515-8916	09159063375
