The 90-90-90 targets were missed, but not by much. At the end of 2020, 84% of people living with HIV knew their HIV status, 87% of people living with HIV who knew their HIV status were accessing antiretroviral therapy, and 90% of people on treatment were virally suppressed.

GLOBAL AND REGIONAL DATA

Building on two decades of progress against AIDS

Forty years have passed since the human immunodeficiency virus (HIV) was first detected and isolated and within a decade acquired immunodeficiency syndrome (AIDS) was killing millions around the world. In 2001 the United Nations (UN) General Assembly convened its first-ever special session on HIV to set a common agenda that propelled global efforts to reverse the pandemic's course. Despite the huge progress achieved in the past 20 years, the immense scale of the AIDS pandemic remains as world leaders at the 2021 United Nations High Level Meeting on AIDS adopted a new Political Declaration pledging urgent, transformative action to end the global AIDS epidemic by 2030.

Antiretroviral medicines that were once deemed too expensive and too complicated for low-resource settings were being taken by an estimated 27.5 million [26.5 million-27.7 million] people living with HIV globally at the end of 2020.

¹ The 90–90–90 targets are: 90% of people living with HIV know their HIV status, 90% of people who know their HIV-positive status are accessing treatment treatment have suppressed viral loads.

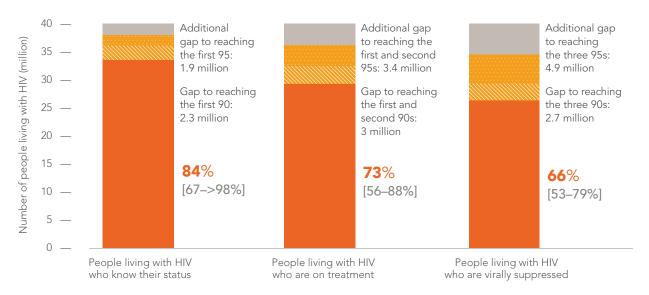

and prevents the further spread of the virus. Derided by some as an aspirational fantasy when they were first proposed by UNAIDS in 2014, the 90–90–90 targets were adopted by the UN General Assembly two years later as a global target for 2020. At the deadline, at least eight countries in a variety of geographic, epidemic and socioeconomic settings had fully achieved the targets, and another 11 had reached 73% viral load suppression among all people living with HIV. The average performance in eastern and southern Africa, the region most affected by HIV, nearly achieved the targets, and 74% of people living with HIV in western and central Europe and North America had suppressed viral loads.

GLOBAL SUMMARY OF THE AIDS EPIDEMIC, 2020

Number of people living with HIV			[30.2 million–45.1 million] [28.9 million–43.2 million] [15.5 million–23.1 million] [1.2 million–2.2 million]
People newly infected with HIV in 2020			[1.0 million–2.0 million] [910 000–1.8 million] [450 000–920 000] [100 000–240 000]
AIDS-related deaths in 2020	Total Adults Women (15+ years) Children (<15 years)	680 000 580 000 240 000 99 000	[480 000–1.0 million] [400 000–850 000] [170 000–360 000] [68 000–160 000]

Source: UNAIDS epidemiological estimates, 2021 (https://aidsinfo.unaids.org/).

HIV TESTING AND TREATMENT CASCADE, GLOBAL, 2020

Source: UNAIDS special analysis, 2021.

At the global level, however, these targets were missed, although not by a wide margin: at the end of 2020, 84% [67–>98%] of people living with HIV knew their HIV status, 87% [67–>98%] of people living with HIV who knew their HIV status were accessing antiretroviral therapy, and 90% [70–>98%] of people on treatment were virally suppressed. These seemingly small gaps add up to leave more than one quarter (27%) of people living with HIV globally not on treatment, and roughly one third with unsuppressed viral loads (Figure above). These gaps are even larger within subpopulations, including children, young people and men.

The global roll-out of HIV treatment has saved millions of lives: an estimated 16.6 million [11.7 million–24.2 million] AIDS-related deaths have been averted over the last two decades, including a 47% decline in AIDS-related mortality since 2010.

Efforts to prevent HIV infections have been less successful. The annual number of new infections among adults globally has hardly changed over the past four years, and total new infections have declined by just 31% since 2010, far short of the 75% target for 2020 that was set by the UN General Assembly in 2016. Too many countries have failed to put in place the combination of structural, behavioural and biomedical approaches to HIV prevention focused on those at greatest risk that experience shows has the maximum impact. Consistent condom use, although possible, has proved difficult to achieve among all populations: women in many countries, for example, need greater agency and support to negotiate consistent condom use. Coverage of pre-exposure prophylaxis (PrEP) and voluntary medical male circumcision (VMMC) in 2020 also were well below the targets set five years earlier.

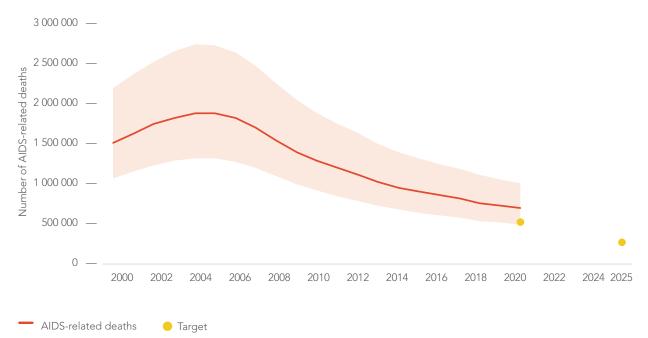

Reductions in new infections were strongest in sub-Saharan Africa and the Caribbean, but no region achieved the 75% declines that were agreed by the UN General Assembly in 2016 (Figure below). Epidemics in large parts of eastern Europe and central Asia expanded in the face of serious legal and policy barriers and inadequate attention to the needs of people who inject drugs and gay men and other men who have sex with men. The annual number of new HIV infections also climbed in the Middle East and North Africa, and Latin America did not achieve any reduction in infections over the course of the last decade.

EVERY DAY THERE ARE 4000 NEW HIV INFECTIONS (ADULTS AND CHILDREN), 2020

- 60% are in sub-Saharan Africa
- 10% are among children under 15 years of age
- 90% are among adults aged 15 years and older, of whom:
 - 51% are among women
 - 31% are among young people (15–24)
 - 20% are among young women (15–24)

Nearly two thirds of children not on treatment are aged 5 to 14 years—children who cannot be found through HIV testing during postnatal care visits.

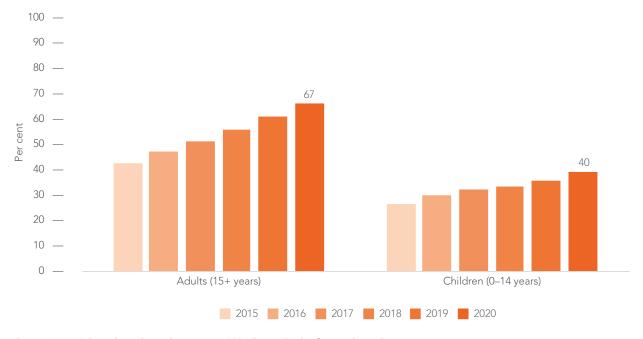

Children being left behind

New HIV infections among children declined by more than half (54%) from 2010 to 2020, due mainly to the increased provision of antiretroviral therapy to pregnant and breastfeeding women living with HIV. However, that momentum has slowed considerably, leaving particularly large gaps in western and central Africa, which is home to more than half of pregnant women living with HIV who are not on treatment.

Eliminating vertical HIV transmission requires improvements across the continuum of efforts to provide women with services as they become sexually active, plan families and go through pregnancy, childbirth and breastfeeding. Programmes need to become better at empowering women to protect themselves from HIV infection, and at finding women who acquire HIV and quickly providing them with antiretroviral therapy in order for them to achieve viral suppression.

Gaps in the testing of infants and children exposed to HIV have left more than two fifths of children living with HIV undiagnosed. The number of children on treatment globally has declined since 2019, leaving almost 800 000 children (aged 0 to 14 years) living with HIV not on antiretroviral therapy in 2020. Just 40% of children living with HIV had suppressed viral loads, compared to 67% of adults (Figure below). Nearly two thirds of children not on treatment are aged 5 to 14 years—children who cannot be found through HIV testing during post-natal care visits. A priority for the next five years is to expand rights-based index, family and household testing and to optimize paediatric treatment in order to diagnose these children, link them to treatment and retain them in life-long care.

PROPORTION OF ADULTS (AGED 15+ YEARS) AND CHILDREN (AGED 0–14 YEARS) WITH SUPPRESSED VIRAL LOAD AMONG PEOPLE LIVING WITH HIV, GLOBAL, 2015–2020

Source: UNAIDS epidemiological estimates, 2021 (https://aidsinfo.unaids.org/).

Criminalization of key populations slowing HIV responses

In every region of the world, there are key populations who are particularly vulnerable to HIV infection. People who inject drugs are at 35 times greater risk of acquiring HIV infection than people who do not inject drugs; transgender women are at 34 times greater risk of acquiring HIV than other adults; female sex workers are at 26 times greater risk of acquiring HIV than other adult women; and gay men and other men who have sex with men are at 25 times greater risk of acquiring HIV than heterosexual adult men. Overall, key populations and their sexual partners accounted for 65% of HIV infections worldwide in 2020 and 93% of infections outside of sub-Saharan Africa.

Key populations continue to be marginalized and criminalized for their gender identities and expression, sexual orientation and livelihoods. An ecological analysis led by Georgetown University's O'Neill Institute for National and Global Health has reinforced smaller-scale studies showing that the criminalization of key populations has a negative effect on HIV outcomes (1). Where same-sex sexual relationships, sex work and drug use were criminalized, levels of HIV status knowledge and viral suppression among people living with HIV were significantly lower than in countries that opted not to criminalize them. Conversely, there was a positive correlation between better HIV outcomes and the adoption of laws that advance nondiscrimination, the existence of human rights institutions and responses to gender-based violence (1).

The risk for key populations to acquire HIV infection in 2020 was:

Gay men and other men who have sex with men: **25 times greater risk** than heterosexual men.

Female sex workers: **26 times greater risk** than women in the general population.

Transgender women: **34 times greater risk** than other adults.

People who inject drugs: **35 times greater risk** than people who do not inject drugs.

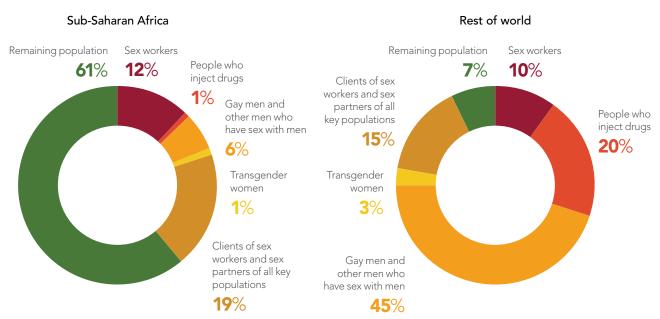

A transgender woman speaks at a UN-supported photo exhibition in Peru. Credit: UNAIDS

Key populations continue to be marginalized and criminalized for their gender identities and expression, sexual orientation and livelihoods

Across countries and regions, important HIV prevention services for key populations are unevenly accessible or entirely absent. Harm reduction services for people who inject drugs, for example, are seldom provided on a meaningful scale across all regions. Similarly, coverage of prevention programmes for gay men and other men who have sex with men is still low, including among many high-income countries. Coverage of prevention programmes for transgender people is meagre in all but a handful of countries. Coverage of prevention programmes among sex workers in eastern and southern Africa is still low. People in prisons and other closed settings are often not provided HIV services, despite the relative ease of reaching them.

DISTRIBUTION OF HIV INFECTIONS, BY POPULATION, GLOBAL, SUB-SAHARAN AFRICA AND REST OF WORLD, 2020

Source: UNAIDS special analysis, 2021 (see Annex on Methods).

Women, men and young people face different challenges

Gender inequality and discrimination robs women and girls of their fundamental human rights, including the right to education, health and economic opportunities. The resulting disempowerment also denies women and girls sexual autonomy, decision-making power, dignity and safety. Gender-based violence is among the most egregious manifestations of gender inequality: it has been shown to increase the risk of acquiring HIV infection for women and girls, and among women living with HIV, it can lead to reduced access and adherence to treatment (2, 3). These impacts are most pronounced in sub-Saharan Africa, where adolescent girls and young women (aged 15 to 24 years) accounted for 25% of HIV infections in 2020, despite representing just 10% of the population.

Sexual and reproductive health and rights are the foundation of the ability of women and girls to prevent the acquisition of HIV. The UN General Assembly has committed to ensuring that 95% of women and girls of reproductive age have their HIV and sexual and reproductive health service needs met by 2025, but very few low- and middle-income countries are currently within reach of that target.

There is evidence that completing secondary education can help protect girls against acquiring HIV infection in places where HIV is common, in addition to its broader social and economic benefits (4). In many countries, however, girls are less likely to complete secondary education than boys, and the quality of their education suffers due to discrimination in schools. Several comprehensive prevention projects are being implemented for adolescent girls and young women in settings with a high incidence of HIV infections. However, the totality of these efforts still lacks the required scale, leaving many women and girls in settings with high HIV burden at substantial risk of infection.

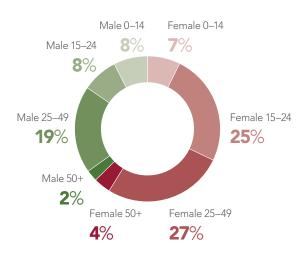

Outside of sub-Saharan Africa, men and boys accounted for 58% of HIV infections in 2020, in part because there are more men than women within key populations and among their sexual partners globally. Across nearly all regions, men are less likely to access HIV services, and men living with HIV consistently fare worse than women across the HIV testing and treatment continuum. Compared to women living with HIV, there are 1 million more men living with HIV who do not know their HIV status, 1.8 million more men who know their status but are not on treatment and 1.6 million more men who are not virally suppressed.

Gender norms that prize male strength and stoicism may partly explain why many men delay seeking care, but other factors are also at play (5). Primary health-care services in eastern and southern Africa place a great deal of focus on women of reproductive age, and reproductive, maternal and child health services offer ideal entry points for HIV services. Similar entry points for men are not commonplace (6, 7). Focused efforts to reach men with HIV services—including through workplace-based interventions and greater use of self-testing approaches, and by providing services at outpatient

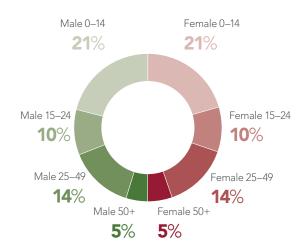

Sexual and reproductive health and rights are the foundation of the ability of women and girls to prevent the acquisition of HIV.

departments—will improve their health outcomes and also help prevent transmission of HIV to their sexual partners.

Young people, including young people within key populations, accounted for 27% of HIV infections in 2020. Young people face parental consent barriers to HIV and sexual and reproductive health services. They also have insufficient access to quality and age-appropriate comprehensive sexuality education, leaving them vulnerable to myths and misinformation about sex and sexuality. Students who receive comprehensive sexuality education are empowered to take responsibility for their own decisions and behaviours, and the ways in which they may affect others. Comprehensive sexuality education also plays a role in preventing gender-based violence, increasing the use of contraception, decreasing the number of sexual partners and delaying the initiation of sexual intercourse.

COMBINATION HIV PREVENTION

Condoms a critical part of combination prevention

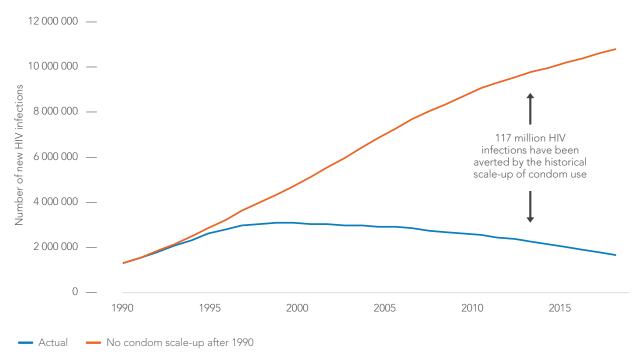

When used correctly and consistently, male and female condoms and lubricant offer very high protection against HIV, sexually transmitted infections (STIs) and unintended pregnancy. Condom use has had an enormous impact on the global AIDS pandemic: model simulations show that increased condom use since 1990 has averted an estimated 117 million new infections, close to half (47%) of them in sub-Saharan Africa and more than one third (37%) in Asia and the Pacific (8).

Condom programmes are among the most cost-effective interventions in the HIV response (9). Assuming an average cost of about US\$ 0.18 for each male condom distributed, each averted HIV infection during 1990–2019 cost approximately US\$ 230 (8). In recent years, however, condom social marketing programmes and condom demand generation have declined. Data from population-based surveys conducted after 2015 also suggest that condom use has declined among young people in several countries in sub-Saharan Africa.

Consistent condom use, although possible, has proved difficult to achieve among all populations. Women in many countries, for example, need greater agency and support to negotiate consistent condom use. Condoms alone, therefore, are not sufficient to control HIV epidemics: if condom use rates are increased to reach the 2025 target of 95% of higher risk sex acts and all other prevention interventions remain at 2019 coverage levels, about one third of the required reductions in HIV infections will be achieved. Full achievement of the 2025 targets requires combining increases in condom availability and use with a full range of prevention choices (8).

HIV prevention for adolescent girls and young women lacks scale and impact

Gender inequality, underpinned by harmful gender norms, restricts women's access to HIV and sexual and reproductive health services. There were 260 000 [150 000–390 000] HIV infections among adolescent girls and young women globally in 2020, far shy of the 2025 target of 50 000. Eighty-three per cent of these infections occurred in sub-Saharan Africa, where adolescent girls and young women (aged 15 to 24 years) account for 25% of HIV infections, despite representing just 10% of the population.

Despite several comprehensive prevention projects being implemented for adolescent girls and young women through the United States President's Emergency Plan for AIDS Relief (PEPFAR) DREAMS partnership, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund), the United Nations Children's Fund (UNICEF) and national programmes such as South Africa's She Conquers, the response in settings with high HIV incidence still lacks in scale and impact. Out of the 38 countries in sub-Saharan Africa with subnational HIV incidence data, 20 countries had a total of 555 subnational locations of high, very high or extremely high HIV incidence. Out of those subnational locations, just 30% (200) had dedicated HIV programmes for adolescent girls and young women in 2020.

HIV INCIDENCE AMONG ADOLESCENT GIRLS AND YOUNG WOMEN (AGED 15-24 YEARS), SUBNATIONAL LEVELS, **SUB-SAHARAN AFRICA,**

Women often denied sexual and reproductive health and rights

Sexual and reproductive health and rights are the foundation of women and girls' ability to prevent the acquisition of HIV. The UN General Assembly has committed to ensuring that 95% of women and girls of reproductive age have their HIV and sexual and reproductive health service needs met by 2025, but very few low- and middle-income countries are currently within reach of that target. Family planning services are an important component of sexual and reproductive health and rights, but the availability of these services varies widely. Across 32 countries with available data between 2015 and 2020, the percentage of women aged 15 to 49 years who had their demand for family planning satisfied by modern methods ranged from about 6% in Albania to 87% in Colombia.

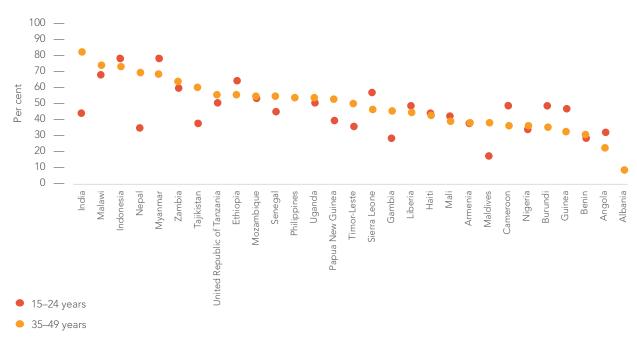

Fulfilment of family planning needs varies by background characteristics. Women were more likely to have their demand for family planning satisfied using modern methods if they were living in urban areas compared to rural areas (in 19 of 32 countries), or if they had secondary or higher education compared to no formal or only primary education (in 21 of 32 countries). That percentage also tended to be higher for older women compared to younger women, and for women in the highest wealth quintile compared with their peers in the lowest quintile. In 17 of the 32 countries, that disparity was not very large (<10%) or not present at all, but it was very wide (>25%) in several others (Angola, Cameroon, Guinea, Mali, Nigeria, Papua New Guinea and Uganda).

Family planning services are an important component of sexual and reproductive health and rights, but the availability of these services varies widely.

Comprehensive sexuality education empowers young people

Comprehensive sexuality education plays a vital role in promoting health, well-being and critical thinking skills among young people and in strengthening responsible citizenship. When it comes to sex and sexuality, young people are vulnerable to myths and misinformation. Students who receive comprehensive sexuality education, however, are empowered to take responsibility for their own decisions and behaviours, and the ways in which their actions may affect others. This helps them make healthier sexual choices and better equips them to seek help when it is needed.

EDUCATION POLICIES THAT GUIDE THE DELIVERY OF LIFE SKILLS-BASED HIV AND SEXUALITY EDUCATION, ACCORDING TO INTERNATIONAL STANDARDS, BY COUNTRY, 2017–2021 Gender-transformative, age- and culturally-appropriate comprehensive sexuality education—both in and outside of school—is a key component of HIV and STI prevention for adolescents and young people. It also plays a role in preventing gender-based violence, increasing the use of contraception, decreasing the number of sexual partners and delaying the initiation of sexual intercourse. Among the 137 countries that have reported data to UNAIDS between 2017 and 2021, 85 (63%) reported having education policies that guide the delivery of life skills-based HIV and sexuality education according to international standards in primary schools, and 111 (81%) reported having such policies in secondary schools. Overall, 84 (62%) reported having such policies for both primary and secondary schools.

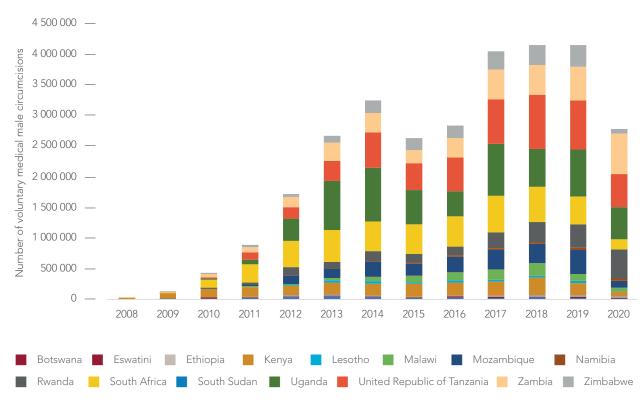

Source: UNAIDS National Commitments and Policy Instrument, 2017–2021.

Male circumcisions disrupted by COVID-19, fall short of the 2020 target

In areas with high HIV prevalence and low rates of male circumcision, VMMC can greatly contribute to HIV prevention. Despite this, there was a steep drop in the number of VMMCs performed in the 15 priority countries in 2020, due mainly to service disruptions caused by the COVID-19 pandemic: approximately 2.8 million procedures were performed in 2020, compared with 4.1 million in 2019. Several countries suspended their programmes when the pandemic took hold, including South Africa, where service coverage has been declining since 2018. Despite this, programmes in some countries proved resilient enough to recover quickly and expand during the rest of 2020—notably in Rwanda and Zambia, where programme coverage grew by about 15%. In these countries, adjustments for the safe continuation of VMMC services during COVID-19 included changes in promotion and demand generation, client transportation, service delivery at a health facility or in the community, and post-procedure follow-up appointments. For example, personal protective equipment was provided to VMMC community mobilizers, clients and staff.

A total of about 18 million VMMCs were performed in 2016–2020, far shy of the 2020 target of 25 million. As well as COVID-19, an additional setback in 2015 and 2016 was the detection of tetanus cases in Uganda, which led to activities being scaled back in that country.

ANNUAL NUMBER OF VOLUNTARY MEDICAL MALE CIRCUMCISIONS, 15 PRIORITY COUNTRIES, EASTERN AND SOUTHERN AFRICA, 2008–2020

Source: UNAIDS Global AIDS Monitoring, 2021 (https://aidsinfo.unaids.org/).

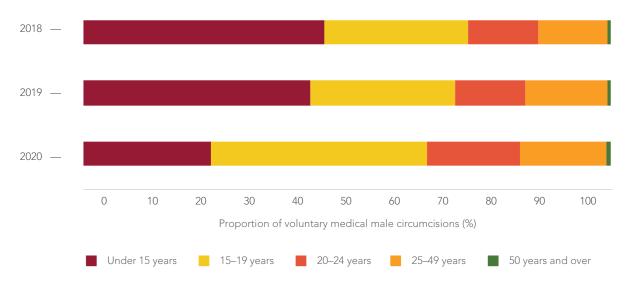

The focus of VMMC services should be on sexually active adolescent boys and adult men at higher risk of HIV infection.

Adolescent boys and young men increasingly reached with VMMC

In areas of low prevalence of circumcision and high HIV burden, the focus of VMMC services should be on providing services to sexually active adolescents 15 years and older and to adult men at higher risk of HIV infection in order to make an immediate impact on HIV incidence (10). In areas where the prevalence of circumcision among sexually active men is already high, a focus on sustaining and expanding VMMC services for adolescent boys over 15 years of age is needed to maintain these high coverage levels and reap the health benefits of the services.

Several priority countries are increasing their VMMC focus on young men, in line with recommendations in the 2020 World Health Organization (WHO) guidance on the subject (10). This has led to a steady increase in the percentage of procedures conducted among young men aged 15 years and older in several countries, but in a number of other countries—including Eswatini, Lesotho, Mozambique and Zimbabwe—at least 30% of VMMCs in 2020 were among males younger than 15 years.

PROPORTION OF VOLUNTARY MEDICAL MALE CIRCUMCISIONS, BY AGE GROUP, 10 COUNTRIES WITH AVAILABLE DATA, 2018–2020

Pre-exposure prophylaxis use expands, but not fast enough

It has been more than a decade since the first evidence of the efficacy of daily oral PrEP was published. PrEP is now a valuable additional option for people who are at higher risk of acquiring HIV, and its global uptake has continued to increase, despite the COVID-19 pandemic: country data show that approximately 845 000 people in at least 54 countries received PrEP in 2020—a 43% increase since 2019, and a 182% increase since 2018. Much of the PrEP scale-up is still highly concentrated in a fairly small number of countries, notably the United States and in eastern and southern Africa, where Kenya and South Africa accounted for 158 630 (19%) of people who received PrEP at least once during 2020 in the region.

There continue to be substantial gaps in the availability of PrEP, however: the total number of people using this prevention option in 2020 was just 28% of the target of 3 million in low- and middle-income countries, which represents only 8% of the new global 2025 target. Access is still poor in much of western and central Africa and Asia and the Pacific, and 20 of 48 countries in Europe still lacked systematic provision of PrEP in 2020 (11). Even in countries with widespread PrEP availability, such as the United States, inequalities are apparent in the divergent rates of PrEP uptake along racial, ethnic, socioeconomic, geographic, age and self-identity lines (12).

NUMBER OF PEOPLE WHO RECEIVED PRE-EXPOSURE PROPHYLAXIS AT LEAST ONCE DURING THE REPORTING PERIOD, GLOBAL, 2016–2020, AND 2020 TARGET

Source: UNAIDS Global AIDS Monitoring, 2017–2021 (https://aidsinfo.unaids.org/); Country Updates. In: PrEPWatch [Internet]. AVAC; c2020 (https://www.prepwatch.org/ in-practice/country-updates/); and country documents and meeting reports (available on request).

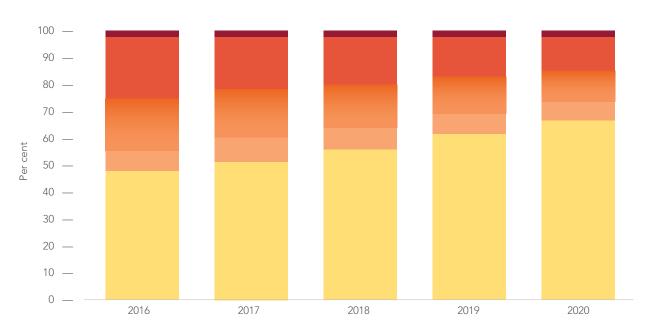

More people living with HIV than ever know their HIV status, are accessing antiretroviral therapy and are achieving the viral suppression required to stay healthy and prevent onward transmission of the virus.

TESTING AND TREATMENT

Gaps narrow across the cascade

Progress across the HIV testing and treatment cascade has included an increase in the proportion of people living with HIV who are virally suppressed, and a narrowing in the proportions of people who are unaware that they are living with HIV and those who know they are living with HIV but have not started treatment or whose treatment was interrupted, suggesting global improvements have been made in HIV testing, linkage to care and retention in care. Reductions in the percentages of people newly infected and those on treatment who are not virally suppressed have been more modest.

PEOPLE LIVING WITH HIV, PEOPLE NEWLY INFECTED IN THE PAST SIX MONTHS, AND HIV TESTING AND TREATMENT CASCADE, ADULTS (AGED 15+ YEARS), GLOBAL, 2016–2020

- People living with HIV who were infected in the past six months
- People living with HIV who don't know their status and were infected more than six months ago
- People living with HIV who know their status but are not on treatment
- People living with HIV who are on treatment but are not virally suppressed
- People living with HIV who are on treatment and are virally suppressed

A diversity of countries achieve 90-90-90

At least eight countries fully achieved the 90–90–90 targets by the end of 2020, and another 11 reached an equivalent 73% viral load suppression among all people living with HIV. The diversity of these 19 countries demonstrates that these ambitious targets can be achieved across income levels, epidemic settings and sociocultural norms.

COUNTRIES REACHING THE HIV TREATMENT CASCADE TARGETS, 2020

	90–90–90 value (all)	90–90–90 value (children aged 0–14 years)	90–90–90 value (women aged 15+ years)	90–90–90 value (men aged 15+ years)	Viral suppression level (all)

- Reached the 90–90–90 targets
- Reached only the 73% viral load suppression target
- Not reached the 90–90–90 target
- Data not available

Source: UNAIDS special analysis, 2021.

^aData are not available on testing and treatment coverage for children. However, because children living with HIV represent less than 1% of the total people living with HIV, adult data were used.

Note: In the 2020 Global AIDS Update, Seizing the moment: tackling entrenched inequalities to end epidemics, Australia, Namibia and the Netherlands were among the countries reaching the 90–90 targets in 2019. Based on the 2020 data, however, Namibia has fallen short of the targets, mainly because of children falling behind. Australia and the Netherlands did not have full estimates on the cascade this year. In the same report, Ireland and Spain were among the countries reaching their viral suppression target at all population levels. This year, however, there was no viral suppression data available for either country.

Note: The UNAIDS models estimated that in the region of western and central Europe and North America, more than 73% of people living with HIV had suppressed viral loads in 2020.

Note: Countries have been assessed as reaching the 90-90-90 targets if coverage is >= 90.0. Thus coverage of 89.9 is not considered as reaching the target. Please see the Annex on Methods for a description of how regional estimates of the testing and treatment targets are calculated.

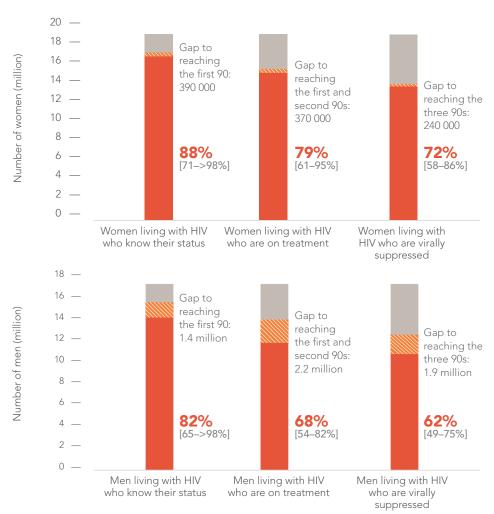

Note: In Eswatini, viral load suppression among all people living with HIV is estimated to be slightly higher than the proportion virally suppressed among people on treatment due to the uncertainty in the number of people on treatment and the number of people living with HIV.

Missing men living with HIV

Globally, the 90–90–90 targets were almost reached among adult women (15 years and older) living with HIV, and they were achieved in eastern and southern Africa and in western and central Europe and North America. Men living with HIV, however, are consistently faring worse than women across the HIV testing and treatment continuum. Compared to women living with HIV, there are 1 million more men living with HIV who do not know their HIV status, 1.8 million more men who know their status but are not on treatment, and 1.6 million more men who are not virally suppressed.

While gender norms that prize male strength and stoicism may partly explain why many men delay seeking care, other factors are also at play (13). Primary health-care services in eastern and southern Africa place a great deal of focus on women of reproductive age, and reproductive, maternal and child health services offer ideal entry points for HIV services; similar entry points for men are not commonplace (14, 15). Interventions to reach and include men more successfully in HIV testing and treatment services are increasing—including through workplace-based interventions and greater use of self-testing approaches, and by providing services at outpatient departments—but a more finely-tuned understanding of why men's use of HIV services continues to lag can help shape additional ways to close this gap (16, 17).

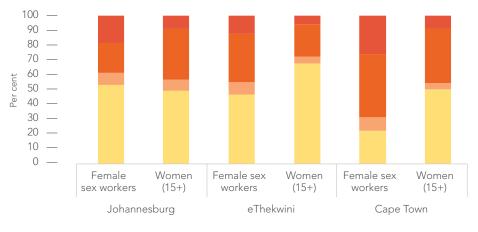

HIV TESTING AND TREATMENT CASCADE, WOMEN (AGED 15+ YEARS) COMPARED TO MEN (AGED 15+ YEARS), GLOBAL, 2020

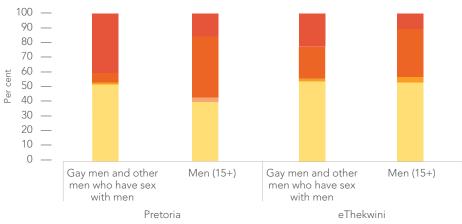

Testing and treatment gaps for key populations

Reaching key populations living with HIV with HIV testing and treatment services has been a challenge across regions. Even HIV programmes that generally are performing well—such as in South Africa—can struggle on that front. HIV testing and treatment data from three mainly urban South African districts show that female sex workers living with HIV were consistently less likely to know their HIV status than adult women overall. In two of the districts, HIV-positive sex workers were also significantly less likely to be receiving HIV treatment and to be virally suppressed (18, 19).

Gay men and other men who have sex with men living with HIV were similarly much less likely to know their HIV status compared with the overall adult male population living with HIV. Strikingly, however, the data from Pretoria and eThekwini districts suggest that, when HIV-positive gay men and other men who have sex with men did know their HIV status, they were more likely than other HIV-positive men to receive antiretroviral therapy and be virally suppressed (18, 19). The variations emphasize the importance of tailoring HIV testing and treatment services at the local level to the challenges and needs of key populations living in the area.

KNOWLEDGE OF STATUS, TREATMENT AND VIRAL SUPPRESSION GAPS AMONG ADULT WOMEN AND FEMALE SEX WORKERS IN SOUTH AFRICA, SELECT DISTRICTS, 2018

KNOWLEDGE OF STATUS, TREATMENT AND VIRAL SUPPRESSION GAPS AMONG GAY MEN AND OTHER MEN WHO HAVE SEX WITH MEN IN SOUTH AFRICA, SELECT DISTRICTS, 2018

- People living with HIV who don't know their status
- People living with HIV who know their status but are not on treatment
- People living with HIV who know their status, are on treatment but are not virally suppressed
- People living with HIV who know their status, are on treatment and are virally suppressed

Tuberculosis remains the leading cause of death among people living with HIV.

Reductions in tuberculosis cases among people living with HIV

Tuberculosis is a preventable and treatable disease—yet it continues to claim millions of lives each year and remains the leading cause of death among people living with HIV (20).

Progress has been achieved in recent years. There has been a steady decline in the estimated number of incident tuberculosis cases among people living with HIV, and a gradual increase in the number of tuberculosis patients living with HIV who are on antiretroviral therapy. However, just 55% of the estimated 815 000 [729 000–906 000] incident cases of tuberculosis globally among people living with HIV in 2019 were diagnosed and notified. Fully 88% of those people living with HIV with diagnosed and notified tuberculosis cases were linked to antiretroviral therapy (20).

NOTIFIED NEW AND RELAPSE TUBERCULOSIS CASES KNOWN TO BE HIV-POSITIVE, NUMBER ON ANTIRETROVIRAL THERAPY AND ESTIMATED NUMBER OF INCIDENT TUBERCULOSIS CASES AMONG PEOPLE LIVING WITH HIV, 2004–2019

Source: UNAIDS Global AIDS Monitoring, 2020 (https://aidsinfo.unaids.org/); Global tuberculosis report. Geneva: World Health Organization; 2020.

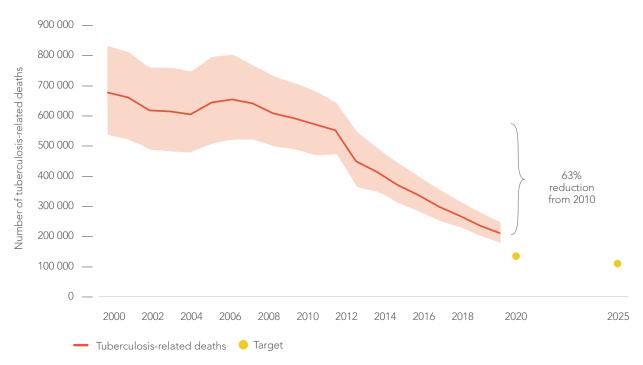

Tuberculosis deaths fall by more than half

There were an estimated 210 000 [177 000–242 000] tuberculosis-related deaths in 2019 among people living with HIV, a 63% reduction since 2010, when tuberculosis claimed the lives of 570 000 [470 000–680 000] people living with HIV. The 2021 Political Declaration on AIDS requires an 80% reduction by 2025 (compared to a 2010 baseline).

The biggest reductions in tuberculosis deaths among people living with HIV have been in India (a 83% reduction since 2010), Kenya (a 70% reduction), South Africa (a 77% reduction) and the United Republic of Tanzania (a 71% reduction). Those achievements represent tens of thousands of averted deaths. In South Africa, for example, an estimated 36 000 people living with HIV died of tuberculosis in 2019, compared with almost 160 000 deaths in 2010.

Progress is much slower in Cameroon, the Democratic Republic of the Congo, Uganda and Zambia. They are among the 30 countries that accounted for 88% of all tuberculosis-related deaths among people living with HIV in 2019.

NUMBER OF TUBERCULOSIS-RELATED DEATHS AMONG PEOPLE LIVING WITH HIV, GLOBAL, 2000–2019 AND TARGETS FOR 2020 AND 2025

ENDING PAEDIATRIC AIDS AND ELIMINATING VERTICAL TRANSMISSION

Fewer children on treatment

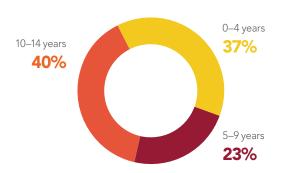

The number of children receiving antiretroviral therapy declined in 2020, leaving almost 800 000 children (aged 0-14 years) living with HIV not on life-saving treatment. Almost two thirds (63%) of those children were aged 5 years and older. Finding undiagnosed older children and adolescents requires an expansion of self-testing, and of rights-based index, family and household testing.

Treatment coverage among children living with HIV (aged 0–14 years) remains far lower than it is among adults (aged 15 years and older): 54% [37–69%] versus 74% [57–90%] in 2020. The health outcomes of children who receive HIV treatment are also worse than those of adults, partly due to suboptimal paediatric HIV medicines and challenges in retaining the children in care. A mere 40% [29–51%] of children living with HIV were virally suppressed in 2020. Children living with HIV require a continuum of treatment, care and social protection that is proven to improve health outcomes as they grow and progress through youth into adulthood.

NUMBER OF CHILDREN LIVING WITH HIV AND THOSE RECEIVING ANTIRETROVIRAL THERAPY, GLOBAL, 2010–2020

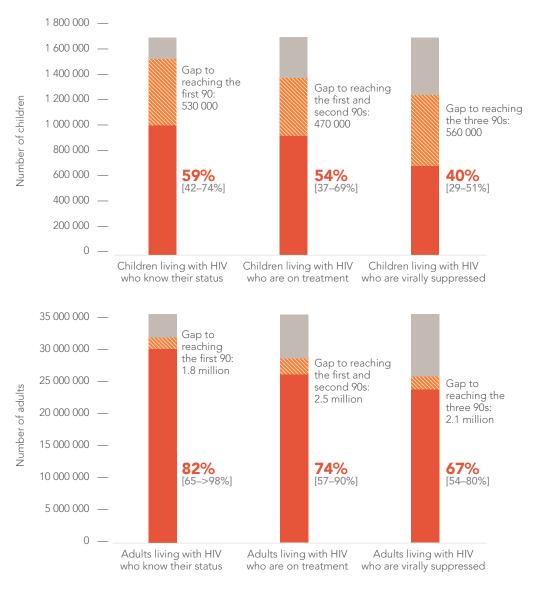

CHILDREN LIVING WITH HIV NOT RECEIVING TREATMENT, BY AGE GROUP, 2020

GENDER EQUALITY

Gender-based violence remains common

Interventions and services to prevent sexual and gender-based violence—and to support survivors of violence—are urgently needed.

Globally, more than one in 10 (13%) ever-married or partnered women (aged 15 to 49 years) have experienced physical and/or sexual violence by an intimate partner in the previous 12 months (21). Only seven of 43 countries with data available between 2015 and 2020 met the 2025 target of less than 10%. Two of those seven countries—the Philippines and Senegal—have conducted multiple surveys over the years that suggest a steady decline in recent intimate partner violence.¹

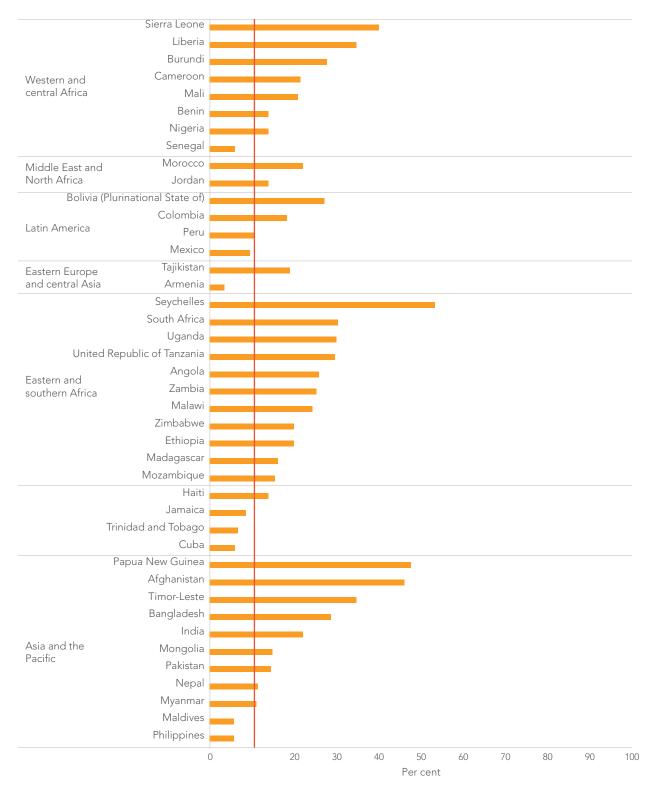

A 2013 World Health Organization (WHO) study on the health burden associated with violence against women found that, in some regions, women who had experienced intimate partner violence were 1.5 times more likely to acquire HIV, compared to women who had not experienced partner violence (22). Similarly, more recent studies from Togo and Uganda—and analysis of population-based survey data in Zambia—have found a higher risk of HIV infection among women reporting various forms of intimate partner violence (23, 24). Women who inject drugs face high levels of physical and sexual violence, which contributes to their high risk of HIV, but they are often ignored by harm reduction programmes because the vast majority of people who inject drugs globally are men (25).

Deeply entrenched stigma and prejudice against LGBTI people—and discriminatory laws and regulations that foster a climate where hate speech, violence and discrimination are condoned—perpetuate high levels of violence against LGBTI communities. Acts of violence range from daily exclusion and discrimination to torture and arbitrary killings. There are no comprehensive and systematic data on the number of victims of violence, but a UN-appointed Independent Expert has estimated that there are millions every year (26). In Virginia, in the United States of America, as many as 45% of transgender individuals experience some form of gender-based victimization, including: physical or sexual violence; social, workplace or housing discrimination; or rejection in family, social or media contexts (27–30). These experiences have been associated with depression and anxiety, substance use and suicide risk (31–33).

Intimate partners are an alarmingly common source of violence towards transgender people. A 2020 systematic review of 74 quantitative data sets on intimate partner violence in transgender populations found a median lifetime prevalence of physical intimate partner violence among transgender individuals of 37.5% (34). Lifetime prevalence of sexual intimate partner violence was 25.0%, past-year physical intimate partner violence was 16.7%, and past-year sexual intimate partner violence was 10.8% (34). In Lima, Peru, a cross-sectional study among 576 gay men and other men who have sex with men and transgender women found that 7.9% of gay men and other men who have sex with men and 15.0% of transgender women reported experiences of intimate partner violence with at least one of their last three partners (35).

¹ Data are from population-based surveys: 2008, 2013 and 2017 in the Philippines, and 2017, 2018 and 2019 in Senegal.

PERCENTAGE OF EVER-MARRIED OR PARTNERED WOMEN (AGED 15–49 YEARS) WHO EXPERIENCED PHYSICAL AND/OR SEXUAL VIOLENCE BY AN INTIMATE PARTNER IN THE PAST 12 MONTHS, COUNTRIES WITH AVAILABLE DATA, BY REGION, 2015–2020

2025 target

Source: Population-based surveys, 2015–2020.

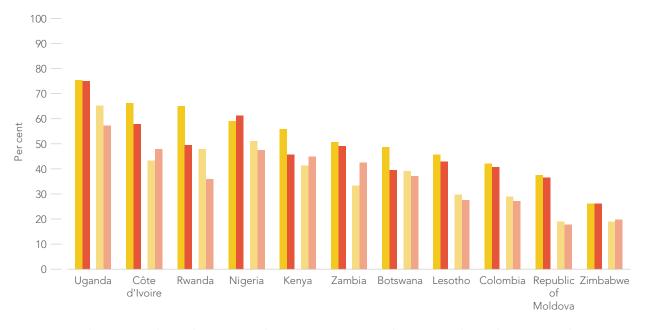

Violence negatively impacts children

Experiences of violence too often occur early in life. Violence in childhood has been linked to increased risks of: HIV and other sexually transmitted infections (STIs); mental health problems; delayed cognitive development; poor school performance and dropout; early pregnancy; reproductive health problems; communicable and noncommunicable diseases; and injury (36).

Among the 11 countries with available data between 2016 and 2020, violence (physical, sexual and/or emotional) experienced within the last 12 months by children (aged 13 to 17 years) ranged from 19.2% in the Republic of Moldova and Zimbabwe to 65.4% in Uganda among males, and from 17.7% in the Republic of Moldova to 57.5% in Uganda among females.

The percentage of young people (aged 18 to 24 years) who experienced one or more types of violence during childhood (before the age of 18) is high across all 11 countries with available data between 2016 and 2020, ranging from 26.3% in Zimbabwe to 75.6% in Uganda among males, and from 26.5% in Zimbabwe to 75.3% in Uganda among females.

CHILDREN (AGED 13–17 YEARS) AND YOUNG PEOPLE (AGED 18–24 YEARS) WHO EXPERIENCED ONE OR MORE TYPES OF VIOLENCE IN CHILDHOOD, COUNTRIES WITH AVAILABLE DATA, 2016–2020

- Male young people (aged 18–24 years) who experienced one or more types of violence before the age of 18
- Male children (aged 13–17 years) who experienced one or more types of violence in the past 12 months
- Female young people (aged 18–24 years) who experienced one or more types of violence before the age of 18
- Female children (aged 13–17 years) who experienced one or more types of violence in the past 12 months

REMOVING PUNITIVE LAWS AND POLICIES

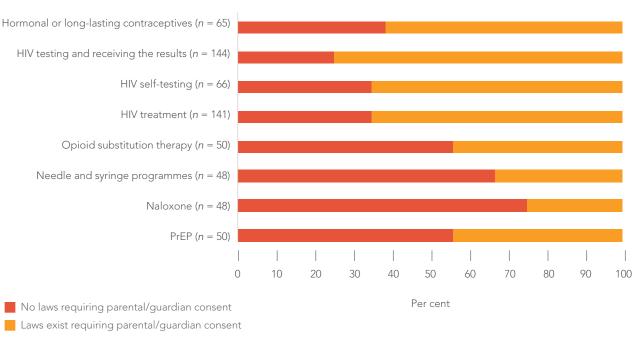

Parental consent laws leave adolescents vulnerable to HIV

Sexual activity often starts during adolescence. Many countries have age of consent laws in relation to sexual activity that are inconsistent with minimum age laws for accessing sexual and reproductive health information and services without parental permission. This means that adolescents may legally have sex before they can legally access any information or services relating to safer sex practices or contraception, leaving them at greater risk of HIV, other STIs and unwanted pregnancy (37).

The removal of laws that require parental permission to access services for sexual and reproductive health and HIV prevention, testing and treatment has been shown to improve health-seeking behaviours (38). That effect is even stronger when schools can provide age-appropriate comprehensive sexuality education to young people so they can protect themselves from HIV, STIs, unwanted pregnancy, and gender-based and sexual violence.

Forty countries reported to UNAIDS in 2021 that they have laws requiring parental/guardian consent for adolescents to access hormonal or long-lasting contraceptives, 108 reported that this consent is required for an HIV test, 43 for HIV self-testing, 92 for HIV treatment and 22 for PrEP. Among these countries, some provide exceptions based on demonstrated maturity: 10 for hormonal or long-lasting contraceptives, 15 for HIV testing, eight for self-testing and nine for HIV treatment. The age cut-off of parental consent laws varied by service. The majority of countries that reported having requirements for parental/guardian consent had an age cut-off of 18 years, with exceptions in a few countries where adolescents as young as 14 years could access a service without parental/guardian consent, which varied by service.

INVESTMENTS TO END AIDS

Stronger and smarter investments needed to end AIDS

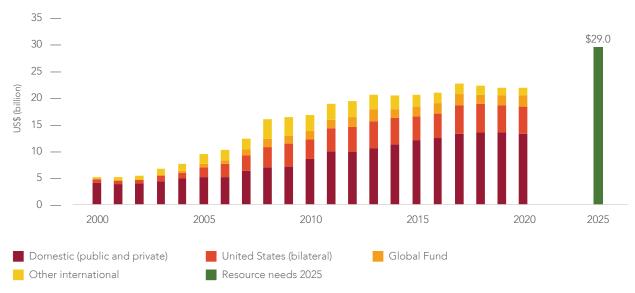

Ending AIDS will require substantial additional domestic investments, reinvigorated international contributions, more efficient allocation of available resources and creative solutions to the reductions in fiscal space caused by the COVID-19 pandemic.

Under-investment in the HIV responses of low- and middle-income countries was a major reason why global targets for 2020 were missed. Financial resource availability during the last five years was consistently below the resources needed, and in 2020, it was 29% less than the US\$ 26 billion target for that year (in constant 2016 US dollars).^{2,3} Domestic funding (public and private), which had been the main source of investment growth for HIV responses in low- and middle-income countries over the last decade, has plateaued and begun to decline. International contributions have fluctuated for 10 years; in 2020, they were at the same level as in 2010. When domestic and donor resource trends are combined, there have been three straight years of decline in total resource availability.

The failure to achieve programmatic and impact targets has translated to more people living with HIV and more people at risk of HIV infection who are in need of services. Higher levels of resources are now needed to get the AIDS pandemic response back on track towards the global goal of ending AIDS by 2030. Annual HIV investments in low- and middle-income countries need to rise from the US\$ 21.5 billion (in constant 2019 US dollars) in resources available in 2020 to reach the 2025 target set within the 2021 Political Declaration on AIDS: US\$ 29 billion (in constant 2019 dollars) for low-and middle-income countries, which in 2020–2021 included countries formerly classified as high-income (Figure below).

² The group of low- and middle-income countries included in the resource availability and needs estimates of this chapter follow the World Bank's country income-level classification for 2020–2021.

RESOURCE AVAILABILITY FOR HIV IN LOW- AND MIDDLE-INCOME COUNTRIES, 2000–2020 AND 2025 TARGET

Source: UNAIDS financial estimates and projections, 2021 (http://hivfinancial.unaids.org/hivfinancialdashboards.html).

Note: The resource estimates are presented in constant 2019 US dollars. The countries included are those that were classified by the World Bank in 2020 as being low- and middle-income.

³ The percentage shortfall compared to the 2020 target uses a 2020 resource availability estimate (US\$ 18.5 billion) measured in 2016 US dollars to match the resource targets in the 2016 Political Declaration on Ending AIDS. The other resource availability and needs estimates in this chapter are measured in 2019 US dollars, consistent with the resource targets in the 2021 Political Declaration on AIDS.

Reaching the global price tag for the AIDS response is just part of the challenge—where funds come from, where they go and how they are spent also require close attention.

Eastern and southern Africa, the region with the highest burden of HIV, accounts for 29% of the estimated resource needs among all low- and middle-income countries for 2025. Asia and the Pacific's substantial share (32%) of total resource needs is due mainly to HIV prevention efforts for its much larger population, as well as higher unit costs in some countries. Higher unit costs also contribute to the relatively high per capita resource needs in Latin America and eastern Europe and central Asia.

Regional patterns in resource availability demonstrate that greater impact is achieved where sufficient funds are invested and used wisely. In eastern and southern Africa, for instance, a combination of domestic and international investments has fuelled the rapid expansion of HIV prevention, testing and treatment in areas with a high burden of HIV, resulting in strong and steady reductions in the rate of HIV infections and AIDS-related mortality. Even though the per capita amounts of resources available in eastern and southern Africa and the Caribbean in 2020 met or even surpassed 2025 investment targets, reductions in infections and deaths are not on track to achieve the 2025 impact targets, reflecting the need for greater efficiency in resource allocation and use within several countries in the region. This pattern is more pronounced in Latin America, where relatively high levels of spending per person living with HIV have been maintained, and HIV prevention efforts have stalled at relatively low incidence (0.16 HIV infections per 1000 population).

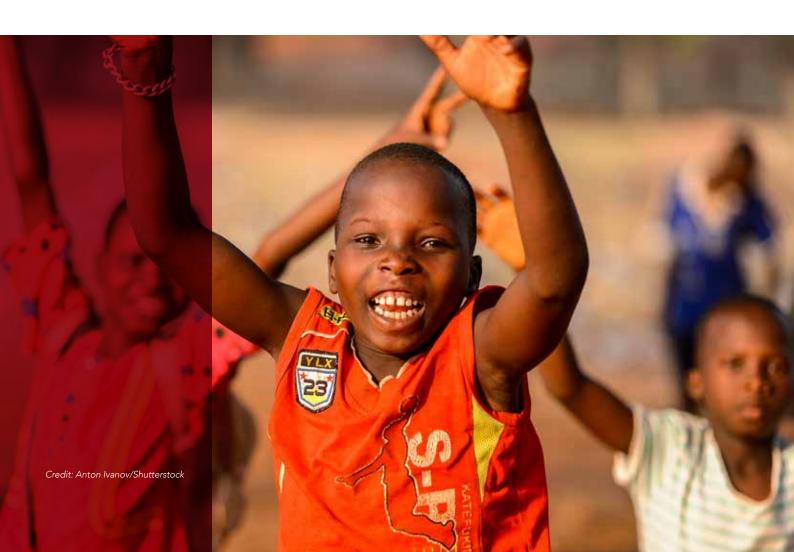

Under-investment in the HIV responses of low- and middleincome countries was a major reason why global targets for 2020 were missed.

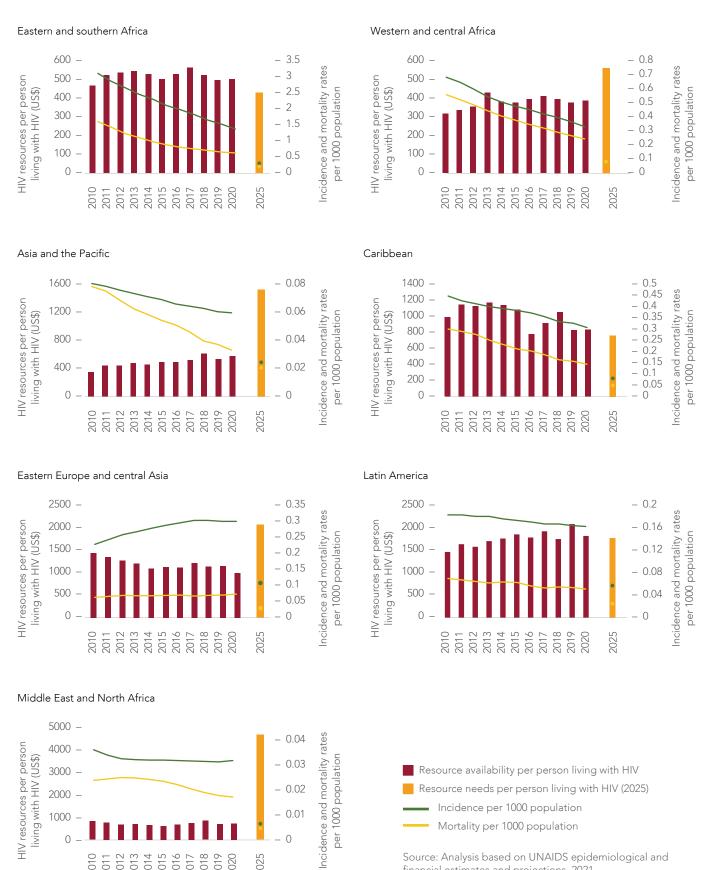

The Global AIDS
Strategy calls for a
doubling of domestic
and international
funding for primary
HIV prevention
interventions, such as
condoms, PrEP and
VMMC.

The resources allocated to effective combinations of HIV prevention services for populations at higher risk of HIV infection are insufficient across most regions. The Global AIDS Strategy 2021–2026 calls for a doubling of domestic and international funding for primary HIV prevention interventions, such as condoms, PrEP and VMMC, increasing from the US\$ 5.2 billion in estimated total expenditures in low- and middle-income countries in 2019 to about US\$ 9.5 billion in 2025. A substantial share of these additional resources for HIV prevention should be focused on key populations in all regions, and on adolescent girls and young women in areas in sub-Saharan Africa with high HIV burden.

Much of the gap between 2020 resource availability and 2025 resource needs for HIV responses is in upper-middle-income countries that generally have more fiscal space to increase domestic resource allocations. By contrast, low-income countries remain heavily reliant on donor resources, in part because some of the countries spend a substantial proportion of their tax revenues on servicing debt. Deficit spending related to the COVID-19 pandemic in countries across all income levels threatens to impact funding availability for HIV responses in the coming years.

EASTERN AND SOUTHERN AFRICA

astern and southern Africa remains the region most heavily affected by HIV, accounting for approximately 55% of all people—and two thirds of all children—living with HIV. It is also the region that has made the strongest progress against the HIV epidemic since 2010: new HIV infections declined by 43% overall from 2010 to 2020, and by 64% among children (aged 0 to 14 years), the sharpest reductions in any region.

As a whole, the region came very close to achieving 2020 targets for testing and treatment—a remarkable achievement given the high burden of HIV in the region. Countries such as Eswatini, Namibia and Zambia have shown tremendous leadership in advancing towards the 90–90–90 targets, with Eswatini already reaching the 95–95–95 targets. Overall, there were 50% fewer deaths due to AIDS-related causes in 2020 compared with a decade earlier.

Such is the scale of the region's epidemic, however, that it still claimed 310 000 [220 000–470 000] lives in 2020, and 670 000 [470 000–930 000] people acquired HIV in the same period. An estimated 58% of those infections were among women and girls, against a background of entrenched gender inequalities and prevalent gender-based violence. Key populations and their sexual partners accounted for 32% of new infections in 2020.

Testing and treatment coverage for men continues to be significantly lower than for women, a trend that jeopardizes the health and lives of men and their partners. Children have experienced much slower progress across the testing and treatment cascade than adults.

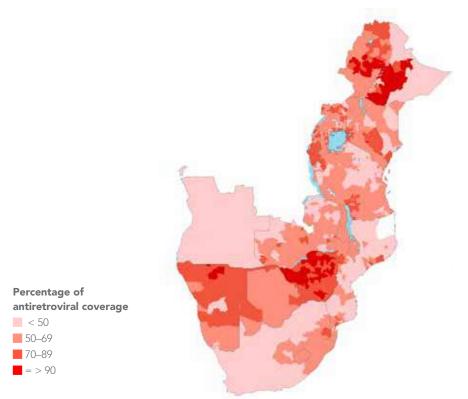

Political commitment remains strong across the region: most countries have adopted ambitious targets for programme expansion and increased domestic funding for their HIV responses. The extensive involvement of community-led organizations and networks in HIV activities is a hallmark of the regional response. Their efforts helped limit disruptions and delays to HIV services caused by the COVID-19 pandemic.

Efforts to improve sexual and reproductive health and rights—including the expansion of comprehensive sexuality education and programmes to reduce gender-based violence, gender inequality, harmful practices and child marriage—are also gathering pace in many countries.

PRIORITY ACTIONS FOR ENDING AIDS

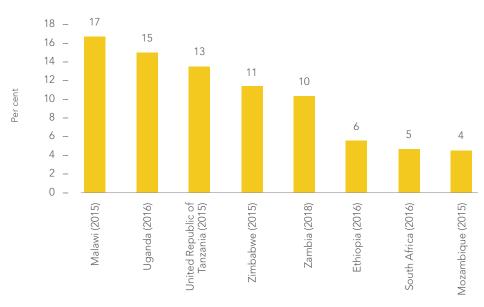

- Expand high-impact combination HIV prevention for key populations, adolescent girls and young women, and young men in all their diversity.
- Preserve gains in testing, treatment and care during the COVID-19 pandemic, and address geographicand populationspecific service coverage gaps that are particularly affecting priority subpopulations.
- Ensure the sustainability of the HIV response, including through greater domestic funding and service integration.
- Address social and structural barriers, including harmful gender and social norms and genderbased violence.
- Empower communities and place them at the centre of national and subnational HIV responses. Strive to tailor HIV and sexual and reproductive health and rights services to the needs of young people in all their diversity, thus ensuring higher service uptake.

Sources: UNAIDS Global AIDS Monitoring, 2021 (https://aidsinfo.unaids.org/); Spectrum Demproj module, 2021; World Population Prospects 2019 [Internet]. New York: United Nations Department of Economic and Social Affairs; c2020 (https://population.un.org/wpp/)(custom data acquired via website).

Note 1: Estimates shown are government-provided estimates reported for 2018–2020. Additional and alternative estimates may be available from different sources, including the Key Populations Atlas (https://kpatlas.unaids.org/), academic publications or institutional documents. Note 2: The regions covered by the local population size estimate are as follows:

Lesotho: Butha Buthe, Leribè, Mafeteng and Maseru.

Malawi: Blantyre, Chikwawa, Chitipa, Dedza, Karonga, Kasungu, Lilongwe, Mangochi, Mulanje, Mzimba, Mzuzu, Nkhata Bay, Nkhotakota, Ntcheu, Ntchisi, Nsanje, Rumphi, Thyolo and Zomba.

Rwanda: Kigali.

South Africa: Cape Town Metro, Durban Metro and Johannesburg Metro.

South Sudan: Wau and Yambio. Zimbabwe: Bulawayo and Harare.

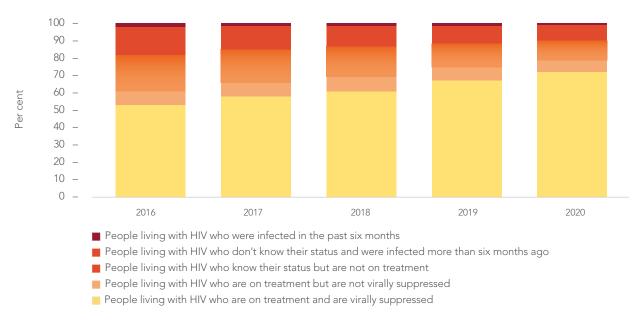

Note 3: The reported values for gay men and other men who have sex with men are presented as a per cent of the adult population (aged 15–49 years) for consistency across key populations. The percentage of this population out of the adult male population (aged 15–49 years) will be approximately twice the values shown.

Criminalization of transgender people

- Criminalized and prosecuted
- Neither criminalized nor prosecuted
- Data not available

Criminalization of sex work

- Any criminalization or punitive regulation of sex work
- Sex work is not subject to punitive regulations or is not criminalized
- Issue is determined/differs at the subnational level
- Data not available

Criminalization of same-sex sexual acts

- Death penalty
- Imprisonment (14 years–life, up to 14 years) or no penalty specified
- Laws penalizing same-sex sexual acts have been decriminalized or never existed, or no specific legislation
- Data not available

Law allows for possession of a certain limited amount of drugs for personal use

- No
- Data not available

Parental consent for adolescents to access HIV testing

- Yes, for adolescents younger than 18
- Yes, for adolescents younger than 14 or 16
- Yes, for adolescents younger than 12
- No
- Data not available

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission

- No, but prosecutions exist based on general criminal laws
- No
- Data not available

Laws or policies restricting the entry, stay and residence of people living with HIV

- Deport, prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Require HIV testing or disclosure for some permits
- No restrictions
- Data not available

Mandatory HIV testing for marriage, work or residence permits or for certain groups

- Yes
- No
- Data not available

Note: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

INVESTING TO END AIDS

Eastern and southern Africa has successfully mobilized resources for the region's AIDS responses during the last decade. Both domestic and international resources increased by 33% between 2010 and 2020. Most of this increase occurred during the 2010–2017 period; the last few years have seen resource availability flatten. In 2020, the United States President's Emergency Plan for AIDS Relief (PEPFAR) and the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) contributed 38% and 11% of regional resources, respectively. A further 41% of resources was mobilized from domestic sources. The amount of resources available in 2020 was similar to the amount needed in 2025. However, a considerable proportion of 2020 resources were not allocated to the programme areas or populations facing the biggest gaps, limiting their impact. It will be vital for the region to emphasize and implement allocative and technical efficiency processes in its programmes in order to use the available resources more efficiently.

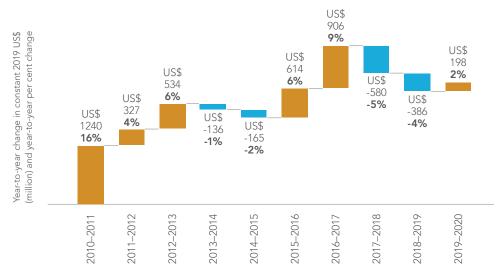

RESOURCE AVAILABILITY FOR HIV, EASTERN AND SOUTHERN AFRICA, 2010–2020, AND ESTIMATED RESOURCE NEEDS FOR HIV BY 2025

WESTERN AND CENTRAL AFRICA

he HIV response across western and central Africa is improving, but not fast enough to end AIDS as a public health threat by 2030. Over the past year, the COVID-19 pandemic has disrupted HIV and other health services, and it has highlighted the vulnerability of people in the region to public health, climatic, socioeconomic and security shocks, along with the pressing need for inclusive social protection systems.

There were 37% fewer new HIV infections in the region in 2020 compared with 2010—steady progress, but far short of the 75% reduction agreed by the United Nations (UN) General Assembly. The region also accounted for more than one third of new HIV infections among children globally in 2020, reflecting ongoing gaps in efforts to prevent vertical transmission, including low coverage of maternal and newborn health services. Overall, 44% of pregnant women living with HIV in western and central Africa were not receiving antiretroviral therapy in 2020.

Key populations and their sexual partners accounted for 72% of new adult HIV infections, and women and girls (aged 15 to 49 years) represented 65%. Adolescent girls and young women continue to be heavily affected by HIV, with a relatively high prevalence of violence against women and girls a contributing risk factor.

Coverage of HIV testing and antiretroviral therapy has grown at a quicker pace in recent years, with nearly three quarters (73%) of people living with HIV receiving antiretroviral therapy in 2020 and 59% virally suppressed. However, just 24% of children (aged 0 to 14 years) living with HIV were virally suppressed in the same year, with poor case finding and linkage to treatment the major gaps.

Stronger political leadership and effective multisectoral partnerships are essential for making health systems more resilient, mobilizing increased domestic resources for high-impact interventions, allocating those resources for programmes focusing on key populations, and removing the user fees and other legal and policy barriers that deter the uptake of life-saving services.

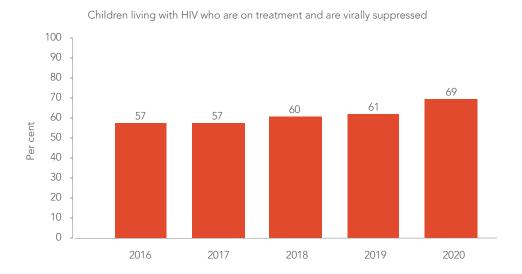

Reaching HIV service targets for 2025 requires addressing human rights and gender barriers, including HIV-related stigma and discrimination, criminalization of key populations and other punitive laws, and the traditional gender roles that condone violence and disempower women and girls. There is also a need to continue the transformation of health systems by promoting peoplecentered service modalities.

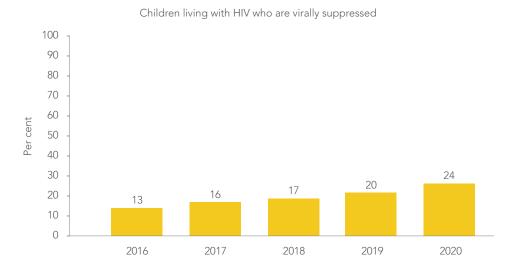

Community-based and other civil society organizations (such as faith-based organizations) are playing stronger roles in the regional response. These organizations are crucial to reaching key and other neglected populations with suitable services, including scaling up access to pre-exposure prophylaxis (PrEP). The West and Central Africa Civil Society Institute is expected to help expand such activities, with the objective of expanding community-led services in the region.

PRIORITY ACTIONS FOR ENDING AIDS

- Reduce stigma and discrimination and gender-based violence by transforming harmful gender and other discriminatory social norms, and by creating an enabling environment for health.
- Ensure preparedness for comprehensive HIV service delivery during humanitarian emergencies and pandemics.
- Scale up high-impact combination HIV prevention for key populations and adolescent girls and young people.
- Strengthen peoplecentred health systems, including community systems, to deliver results for the most vulnerable.
- Close gaps in service availability and the uptake of paediatric HIV treatment to prevent vertical transmission.
- Promote an accountable, inclusive and sustainable HIV response through multisectoral partnerships, including for issues beyond HIV.
- Establish health situation rooms, improve resource tracking and develop new analytics for epidemiological estimates, including analysis of the contributions of key populations to specific epidemics.

PROPORTION OF CHILDREN (AGED 0-14 YEARS) LIVING WITH HIV WITH SUPPRESSED VIRAL LOAD, WESTERN AND CENTRAL AFRICA, 2016–2020

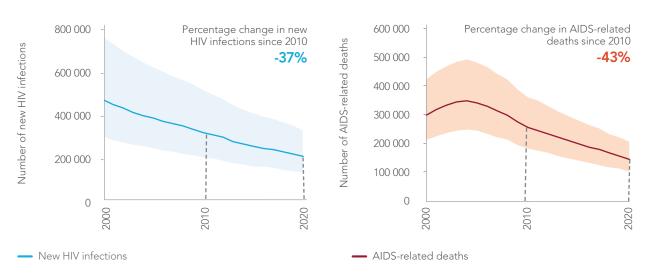

Source: UNAIDS epidemiological estimates, 2021 (https://aidsinfo.unaids.org/).

The single biggest paediatric treatment challenge in western and central Africa is to rapidly find children who are living with HIV and link them to care. Just 24% of children living with HIV in the region had suppressed viral loads in 2020 (Figure above). Family-based index testing and integrating HIV screening with other child health services are critical to closing this gap. Data show that once children are diagnosed and linked to care, the majority do well, with seven in 10 on treatment having suppressed viral loads.

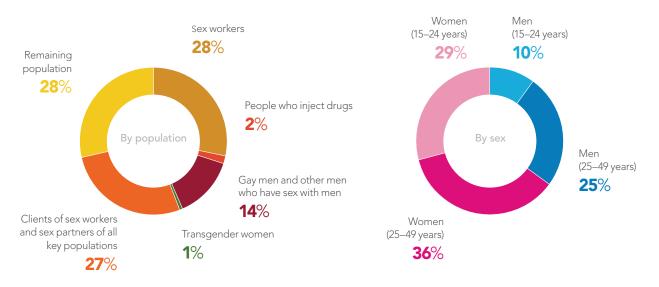

STATE OF THE PANDEMIC

NUMBER OF NEW HIV INFECTIONS AND AIDS-RELATED DEATHS, WESTERN AND CENTRAL AFRICA, 2000–2020

National population size estimate

Insufficient data

Local population size estimate

No data

Sources: UNAIDS Global AIDS Monitoring, 2021 (https://aidsinfo.unaids.org/); Spectrum Demproj module, 2021.

Note 1: Estimates shown are government-provided estimates reported for 2018–2020. Additional and alternative estimates may be available from different sources, including the Key Populations Atlas (https://kpatlas.unaids.org/), academic publications or institutional documents. Note 2: The regions covered by the local population size estimate are as follows:

Central African Republic: Capitale (Bangui), prefectures (Berbérati and Bouar), subprefectures (Boali and Carnot).

Chad: Eleven cities in the country.

Côte d'Ivoire: Abengourou, Abidjan, Bouaké, Divo, Gagnoa, Issia, Korhogo, Man, Ouangolodougou, San-Pédro and Yakro (gay men and other men who have sex with men); Bouaké, San-Pédro and Yamoussoukro (people who inject drugs); Abidjan (transgender people). Gambia: Banjul.

Mali: Bamako, Kayes, Koulikoro, Mopti, Ségou and Sikasso (sex workers); Bamako, Gao, Kayes, Koulikoro, Mopti, Ségou and Sikasso (gay men and other men who have sex with men).

Mauritania: The six biggest cities in the country.

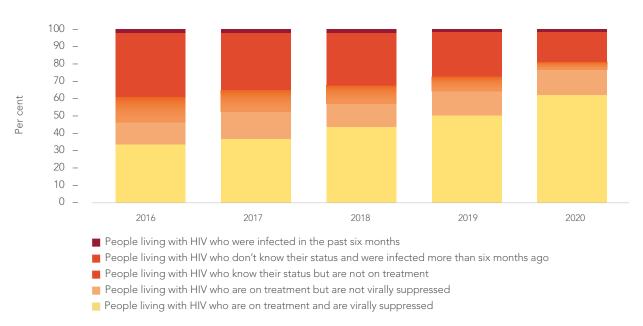

Note 3: The reported values for gay men and other men who have sex with men are presented as a per cent of the adult population (aged 15–49 years) for consistency across key populations. The percentage of this population out of the adult male population (aged 15-49 years) will be approximately twice the values shown.

Criminalization of transgender people

- Criminalized and/or prosecuted
- Neither criminalized nor prosecuted
- Data not available

Criminalization of sex work

- Any criminalization or punitive regulation of sex work
- Sex work is not subject to punitive regulations or is not criminalized
- Issue is determined/differs at the subnational level
- Data not available

Criminalization of same-sex sexual acts

- Death penalty
- Imprisonment (14 years–life, up to 14 years) or no penalty specified
- Laws penalizing same-sex sexual acts have been decriminalized or never existed, or no specific legislation
- Data not available

Law allows for possession of a certain limited amount of drugs for personal use

- No
- Yes
- Data not available

Parental consent for adolescents to access HIV testing

- Yes, for adolescents younger than 18
- Yes, for adolescents younger than 14 or 16
- Yes, for adolescents younger than 12
- No
- Data not available

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission

- Ye:
- No, but prosecutions exist based on general criminal laws
- No
- Data not available

Laws or policies restricting the entry, stay and residence of people living with HIV

- Deport, prohibit short and/or long stay and require
 HIV testing or disclosure for some permits
- Prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Require HIV testing or disclosure for some permits
- No restrictions
- Data not available

Mandatory HIV testing for marriage, work or residence permits or for certain groups

- Yes
- No
- Data not available

Note: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

INVESTING TO END AIDS

There is a substantial funding gap in western and central Africa. The resources available for HIV responses in the region in 2020 were approximately three quarters the amount needed in 2025. Total HIV resources in the region declined by 11% between 2010 and 2020. Domestic resources have increased by 6% during the last decade, peaking in 2018 before declining by 15% over the next two years. The sources of international funding have changed significantly in the region. The United States President's Emergency Plan for AIDS Relief (PEPFAR) and the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) increased their contributions to the region by 23% and 85%, respectively, between 2010 and 2020, while all other international resources have reduced their contributions by 79%. Both external and domestic resources need to grow in order to meet the 2025 targets. Resource availability per person living with HIV will have to be increased from the current US\$ 398 in 2020 to US\$ 539 by 2025.

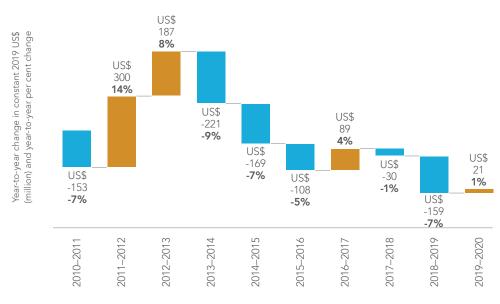

RESOURCE AVAILABILITY FOR HIV, WESTERN AND CENTRAL AFRICA, 2010–2020, AND ESTIMATED RESOURCE NEEDS FOR HIV BY 2025

ASIA AND THE PACIFIC

rogress against HIV in Asia and the Pacific continues to be uneven. Several countries have achieved wide and effective coverage of testing and treatment services, and Thailand and Viet Nam have reduced new HIV infections by at least 50% since 2010. Some countries are focusing on sustaining and integrating their HIV programmes in their overall health system and as part of efforts to achieve universal health coverage.

Contrary trends in other countries, however, saw new HIV infections in the region decline by only 21% overall between 2010 and 2020. Rapidly growing HIV epidemics are underway among key populations in countries such as Indonesia, Pakistan and the Philippines, with gay men and other men who have sex with men especially affected. Across the region, over 94% of new HIV infections are among key populations and their sexual partners, and more than one quarter of new infections are among young people (aged 15 to 24 years).

The centrality of community-led services became even more evident during the COVID-19 pandemic. Across the region, community-led organizations ensured the continuity of vital HIV services and commodities, including pre-exposure prophylaxis (PrEP) and antiretroviral therapy. These organizations operate in less-than-ideal conditions, however: despite positive legislative changes in some countries, hostile legal environments and policing practices—and stigma and discrimination—hinder the provision and use of HIV services for populations that need them the most.

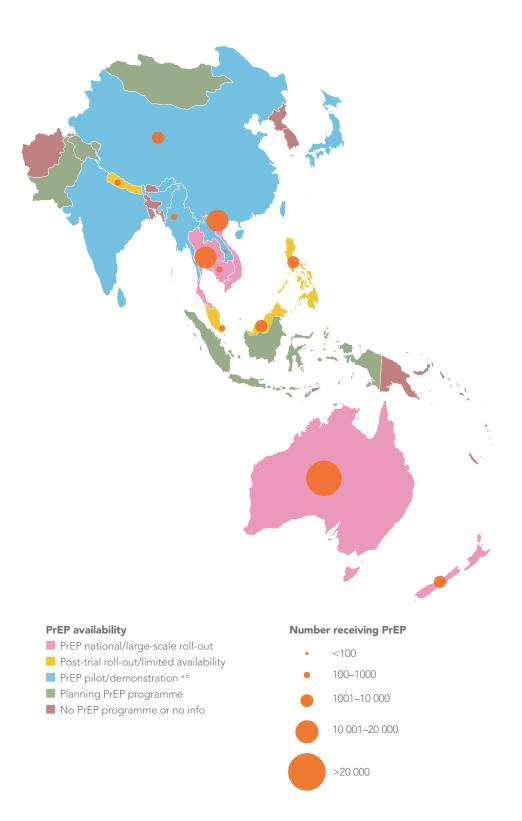

The transition from a reliance on external funding to domestic financing of essential services for HIV, sexually transmitted infections (STIs) and viral hepatitis is proving to be a challenge for several countries, especially in the context of economic setbacks caused by the COVID-19 pandemic.

Moving forward, service delivery for combination HIV prevention and treatment needs to be modernized and diversified using innovative approaches, with improved investments in better programme management, coordination and capacity.

PRIORITY ACTIONS FOR ENDING AIDS

- Emphasize rightsbased approaches in policies and programmes, and tackle harmful social norms.
- Modernize differentiated service delivery, including scale-up of combination HIV prevention (particularly PrEP and harm reduction interventions), selftesting, multimonth dispensing, and maximizing the benefits of U = U (Undetectable = Untransmittable).
- Eliminate stigma and discrimination and other barriers to equitable service coverage.
- Mobilize sustainable domestic financing for prevention and treatment.
- Ensure inclusive and gender-responsive approaches, especially for young key populations.
- Reframe country responses to address inequalities through civil society and community engagement.

STATUS OF PRE-EXPOSURE PROPHYLAXIS (PREP) AVAILABILITY AND NUMBER OF PREP USERS, ASIA AND THE PACIFIC, 2020

Note: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

INVESTING TO END AIDS

Despite a steady increase in domestic investments, the total amount of resources available for HIV responses in Asia and the Pacific has remained stable over the last five years. HIV resources from domestic sources have doubled since 2010, but this has been offset by a 50% decline from international sources during the same period. Investments from the United States Government's bilateral contributions, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund) and other international sources have declined by 12%, 10% and 72%, respectively, since 2010.

In 2020, US\$ 3.5 billion was available for the HIV response in the region, 82% of which came from domestic funding. The Global Fund contributed 7% of the overall resources in 2020, and bilateral contributions from the United States Government represented 5%. There is a US\$ 5.7 billion gap between the resources available and the US\$ 9.2 billion needed to reach the region's annual resource needs in 2025.

RESOURCE AVAILABILITY FOR HIV, ASIA AND THE PACIFIC, 2010–2020, AND ESTIMATED RESOURCE NEEDS FOR HIV BY 2025

LATIN **AMERICA**

These shortcomings reflect that key populations have inadequate access to suitable HIV services, and that they continue to experience stigma and discrimination, physical and sexual harassment, violence and other human rights violations. These barriers are undermining the impact of HIV prevention and

between 2010 and 2020, with approximately 31 000 [20 000–46 000] adults and

children dying of AIDS-related causes in 2020.

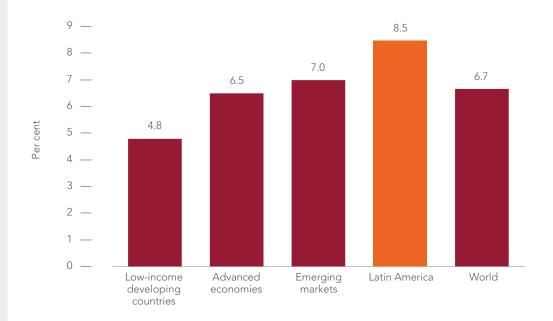

There is a dearth of detailed strategic information available on key populations in many countries, and HIV services for key populations continue to be significantly underfunded in nearly all countries in the region, despite generally strong resource availability. Countries need to reallocate HIV resources to high-impact programmes that reach and benefit key populations, including expanded provision of pre-exposure prophylaxis (PrEP). In 2020, only six of 17 countries in the region reported that that PrEP was provided within the national health system, and only one reported offering self-testing.

COVID-19 has damaged economies in the region, placing health systems under additional strain and driving millions of people into financial peril. Quick and creative responses, however—such as implementing multimonth dispensing and sharing antiretroviral medicine stocks among countries in the region—managed to limit disruptions to HIV services in most countries. Close to 90% of countries in Latin America are implementing social protection strategies or policies, although only a few of those programmes are explicitly benefitting people living with HIV and key populations.

PRIORITY ACTIONS FOR ENDING AIDS

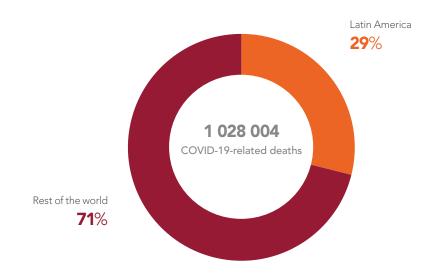

- Promote equitable access to effective and innovative combination HIV prevention within the frameworks of the Sustainable Development Goals and universal health coverage.
- Enact protective legislation, including antidiscrimination and gender identity laws.
- Empower and fully resource gender-sensitive and innovative community-led responses.
- Implement evidence-informed and human rightsbased national responses, with efficient allocation of domestic resources and sustainable financing.
- Expand multimonth dispensing and transition to dolutegravir-based first-line regimens.
- Guarantee access to comprehensive HIV services for migrants and asylum seekers.

Sources: UNAIDS Global AIDS Monitoring, 2021 (https://aidsinfo.unaids.org/); Spectrum Demproj module, 2021.

Note 1: Estimates shown are government-provided estimates reported for 2018–2020. Additional and alternative estimates may be available from different sources, including the Key Populations Atlas (https://kpatlas.unaids.org/), academic publications or institutional documents. Note 2: The regions covered by the local population size estimate are as follows:

Colombia: Bogotá, Cali and Medellín.

Costa Rica: Gran Área Metropolitana.

Panama: Azuero, Bocas del Toro, Chiriquí, Coclé, Comarca Ngäbe-Buglé, Panamá Centro, Panamá Este, Panamá Norte, Panamá Oeste and

Paraguay: Alto Paraná, Amambay, Área Metropolitana (Asunción and Central) and Caaguazú (sex workers); Alto Paraná, Asunción, Caaguazú and Central (gay men and other men who have sex with men); Amambay, Asunción and Central (transgender people).

Note 3: The reported values for gay men and other men who have sex with men are presented as a per cent of the adult population (aged 15–49 years) for consistency across key populations. The percentage of this population out of the adult male population (aged 15-49 years) will be approximately twice the values shown.

Criminalization of transgender people

- Criminalized and/or prosecuted
- Neither criminalized nor prosecuted
- Data not available

Criminalization of sex work

- Any criminalization or punitive regulation of sex work
- Sex work is not subject to punitive regulations or is not criminalized
- Issue is determined/differs at the subnational level
- Data not available

Criminalization of same-sex sexual acts

- Death penalty
- Imprisonment (14 years–life, up to 14 years) or no penalty specified
- Laws penalizing same-sex sexual acts have been decriminalized or never existed, or no specific leaislation
- Data not available

Law allows for possession of a certain limited amount of drugs for personal use

- No
- Yes
- Data not available

Parental consent for adolescents to access HIV testing

- Yes, for adolescents younger than 18
- Yes, for adolescents younger than 14 or 16
- Yes, for adolescents younger than 12
- No
- Data not available

Laws criminalizing the transmission of, non-disclosure of or exposure to HIV transmission

- No, but prosecutions exist based on general criminal laws
- No
- Data not available

Laws or policies restricting the entry, stay and residence of people living with HIV

- Deport, prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Require HIV testing or disclosure for some permits
- No restrictions
- Data not available

Mandatory HIV testing for marriage, work or residence permits or for certain groups

- No
- Data not available

Note: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

INVESTING TO END AIDS

Most countries in Latin America have successfully mobilized large amounts of domestic resources for their HIV responses. There is just an 8% gap between the resources available in the region in 2020 and the amount needed in 2025. However, a stabilization in HIV infections and slow reductions in AIDS-related mortality suggests that much better use of available resources is required. Domestic resources increased by 79% from 2010 to 2020, accounting for 98% of all HIV resources in 2020. Resources from international sources decreased by 55% over the same period. In aggregate, the resources for HIV in the region increased by 70% during the last decade. There is a need to bring down the unit prices of antiretroviral medicines and to increase spending on HIV prevention programmes that are focused on key populations at higher risk of HIV infection.

 Safe injection rooms available (2021) No

he Caribbean has made steady progress against AIDS, especially in providing life-saving testing and treatment to people living with HIV. AIDSrelated deaths have been cut in half since 2010, although the region fell short of the 2020 testing and treatment targets: 82% [70–96%] of people living with HIV knew their HIV status, 82% [68–97%] who knew their HIV-positive status were receiving treatment and 89% [74->98%] of people on treatment were virally suppressed.

Community-led organizations in the region have shown that, if they are adequately supported, they can play a major role in addressing inequalities in HIV service access through more efficient case finding and strengthened linkage to treatment and care, and by ensuring confidential and consistent psychosocial support along the continuum of care. These organizations are especially adept at reaching key populations who, along with their sexual partners, accounted for 68% of new HIV infections in the region in 2020.

The COVID-19 pandemic and natural disasters have disrupted health systems, exacerbating financial, technical and human resource gaps in health services. Overcoming these disruptions and continuing HIV service expansion towards the 2025 targets requires the full implementation of best practices in combination prevention, testing and treatment. This includes self-testing, rights-based index testing, multimonth dispensing and transition to more effective first-line

The pandemic has also fueled gender-based violence, which—along with gender inequalities and stigma and discrimination—continue to impede the region's HIV response. Despite some policy progress towards eliminating gender- and sex-based discrimination, unequal gender relations remain the norm, and sexual minorities are exposed to harsh social stigma and discrimination. An integrated approach to HIV, sexual and reproductive health, and gender-based violence services would help reach adolescent girls and young women and neglected key populations.

PRIORITY ACTIONS FOR ENDING AIDS

- Strengthen regional and national ownership and governance of HIV responses.
- Implement policies that remove structural barriers to HIV services.
- Repeal laws and policies that criminalize people living with and at risk of HIV.
- Strengthen strategic HIV and sexually transmitted infection (STI) programme planning, monitoring and evaluation, and accountability.
- Improve data quality and strengthen surveillance for monitoring the HIV response and providing evidence for strategic decision-making.
- Eliminate vertical transmission in additional countries and ensure the re-validation of countries that have already been validated.

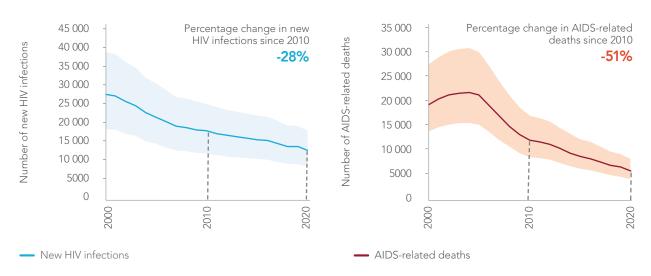

Brandy Rodriguez of the Trinidad and Tobago Transgender Coalition. On International Transgender Day of Visibility (31 March 2021), the United Caribbean Trans Network launched the results of a study that features feedback from transgender and other gender-diverse respondents from 11 countries in the region, garnered from surveys, individual interviews and focus group sessions. Respondents identified the inability to change their gender marker, employment discrimination and discrimination in health services as the top challenges facing the community. Except for Cuba, no Caribbean country allows transgender people to modify their gender on official identification.

Note: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

INVESTING TO END AIDS

The resources available for HIV responses in the Caribbean in 2020 were 74% of the region's resource targets for 2025. Relatively large investments per person living with HIV—including a large proportion of donor support—have coincided with steady reductions in the rates of infections and deaths. Resource availability has fluctuated in recent years, rising by 15% between 2017 and 2018, followed by a 13% decrease between 2018 and 2019. It then rose again, increasing 7% between 2019 and 2020.

MIDDLE EAST AND NORTH AFRICA

he Middle East and North Africa has a long road ahead in fully addressing its AIDS epidemic. New HIV infections rose by 7% between 2010 and 2020—making it one of only two regions in the world where new HIV infections are still on the rise. 95% percent of new adult infections in 2020 occurred among key populations and their sexual partners. AIDS-related deaths have declined by 17% since 2010, but that fall is much faster among women (24%) than men (12%).

Recent years have seen significant advances in the region's HIV response, including the emergence of community-led networks representing people living with HIV and key populations, and legal reforms in a number of countries. Several countries, among them Algeria and Morocco, have made notable progress in expanding access to HIV services, while others—including Somalia and Sudan—have encountered significant challenges.

As a whole, the region is lagging in attaining the 2020 Fast-Track Targets: only 61% of people living with HIV were aware of their HIV status in 2020, 43% of people living with HIV were on treatment and 37% of people living with HIV were virally suppressed. Coverage of services to prevent vertical transmission is also off-track, and only 47% of children (aged 0 to 14 years) with HIV were on treatment in 2020. The Middle East and North Africa is also far behind in fully integrating HIV counselling and testing with sexual and reproductive health services.

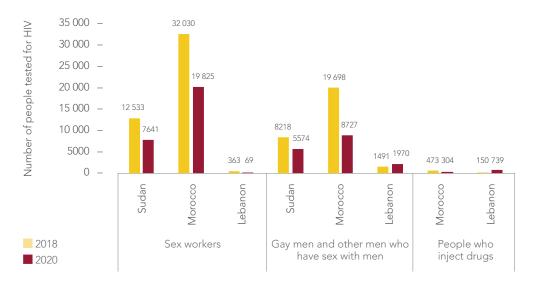

The current gaps in HIV services across the Middle East and North Africa reflect long-standing challenges, including restrictive sociocultural norms that are mirrored in proscriptive laws and policies, and widespread stigma and discrimination. Modest political leadership on HIV is reflected in the low financial investment in the AIDS response. Matters are not helped by widespread humanitarian crises, including protracted conflicts and other forms of political instability, that make the Middle East and North Africa home to the world's largest migrant, refugee and internally displaced populations.

Progress towards the 2030 goals will depend on opening space for civil society and community-led organizations, and on linking the HIV response to efforts to achieve universal health coverage, expand social protection systems and enhance access to sexual and reproductive health and rights. None of this will be possible without stronger commitment from governments, including greater domestic funding and social contracting, and without a wider recognition of the connections between HIV and the other Sustainable Development Goals to which countries are committed.

PRIORITY ACTIONS FOR ENDING AIDS

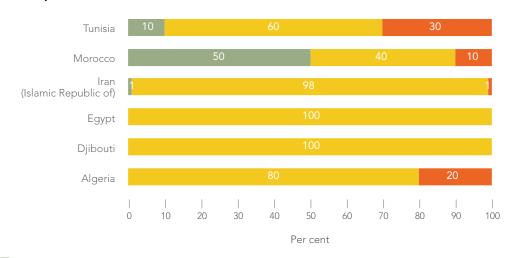

- Scale up access to high-quality, combination HIV prevention, testing and treatment, with a focus on key populations and other priority groups.
- Collect and employ timely, accurate and disaggregated data to achieve transformative results.
- Strengthen, empower and resource communities, including people living with HIV and key populations, to lead the HIV response.
- Ground the response in human rights and gender equality.
- Ensure preparedness for comprehensive and integrated HIV service delivery during humanitarian emergencies and pandemics.

Notes: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

SOCIETAL ENABLERS

EVER-MARRIED OR PARTNERED WOMEN (AGED 15–49 YEARS) WHO EXPERIENCED PHYSICAL AND/OR SEXUAL VIOLENCE BY AN INTIMATE PARTNER IN THEIR LIFETIME, COUNTRIES WITH AVAILABLE DATA, MIDDLE EAST AND NORTH AFRICA, 2018

Source: Violence against women prevalence estimates, 2018: global, regional and national prevalence estimates for intimate partner violence against women and global and regional prevalence estimates for non-partner sexual violence against women. Geneva: World Health Organization; 2021.

The COVID-19 pandemic and extended lockdowns have disrupted HIV services across the Middle East and North Africa, especially in settings affected by humanitarian emergencies and particularly for key populations. That being said, COVID-19 has also spurred innovations in service delivery. Multimonth dispensing of antiretroviral medicines in the Middle East and North Africa, once a rarity, has risen significantly in a number of countries across the region, thanks in large part to the efforts of civil society organizations, which have helped fill gaps in public and private health care provision caused by the COVID-19 pandemic.

COVID-19 has also shone a bright light on gender inequalities across the region. Gender-based violence, already a growing problem across the region, has been exacerbated by lockdowns and other pandemic-related drivers (1). The pandemic has increased the burden of unpaid care on women and girls, further undermined their prospects of employment (which were already modest in many countries), put their educational gains at risk and heightened the prevalence of harmful practices such as child marriage and female genital mutilation. All of these risks are intertwined and are part of the complex fabric of vulnerabilities to HIV experienced by women and girls.

INVESTING TO END AIDS

Resource availability from both domestic and external sources in the Middle East and North Africa has fluctuated over the past decade. One constant feature has been the large gap between what is available and what is needed: the resources available in 2020 were less than 20% of what is required to scale up HIV programmes and achieve the 2025 targets.

The COVID-19 pandemic and the accompanying economic downturn is making a difficult funding environment even more challenging. Increasing domestic investments in HIV responses will require formulating well-prioritized and fully costed national strategic plans and investment cases. It will also necessitate positioning HIV within broader efforts to reach the Sustainable Development Goals, including integration of HIV into social protection schemes and universal health coverage. A regional HIV response with community-led action at its heart will also benefit from forging partnerships with new regional donors, the private sector and philanthropic foundations, as well as innovative financing models, such as social contracting.

EASTERN EUROPE AND CENTRAL ASIA

Europe and central Asia is failing to control its HIV epidemic, with new HIV infections and AIDS-related deaths both continuing to rise. The annual number of new HIV infections increased by an estimated 43% from 2010 to 2020, making this the fastest growing HIV epidemic in the world. Key populations and their sex partners account for virtually all new infections in the region, with an estimated 43% of new adult HIV infections occurring among people who inject drugs. Criminal laws are still being applied too broadly, including unintentional HIV transmission, non-disclosure of HIV status or exposure to HIV where HIV was not actually transmitted.

AIDS-related deaths rose by 32% between 2010 and 2020 in the context of poorly performing testing and treatment programmes in most countries in the region. Overall, 70% of people living with HIV knew their HIV status, 53% were receiving antiretroviral therapy, and 50% were virally suppressed. Diagnosing people living with HIV and linking them to treatment and care are the biggest gaps in the region's treatment efforts. Bridging those gaps will be exceedingly difficult as long as key populations are subject to punitive laws, aggressive policing and social stigma.

The withdrawal or reduction of external donor financing for HIV programmes in the region has challenged efforts to preserve and expand access to essential HIV services. Services provided by civil society organizations are key to enhancing the region's HIV response, but in several countries, these organizations operate in restrictive environments, limiting their contributions to the HIV response. Administrative and financial barriers, including restrictions on foreign funding and complicated registration procedures, are among the impediments they face.

After being hard-hit by the COVID-19 pandemic, a combination of resilient health-care systems, multimonth dispensing of antiretroviral medicines, the use of Internet-based and social media platforms, and the exceptional work of nongovernmental organizations have ensured that many people living with HIV

PRIORITY ACTIONS FOR ENDING AIDS

- Urgently
 expand access
 to combination
 HIV prevention,
 including pre exposure
 prophylaxis (PrEP)
 and harm reduction.
- Close gaps in the testing and treatment cascade by fully rolling out a treat all approach, including improving testing strategies and expanding access to affordable and quality-assured antiretroviral medicines.
- Institutionalize community-led services within national health-care and HIV prevention systems.
- Build human rightsbased responses by transforming harmful gender norms, reducing genderbased violence, and removing discriminatory and punitive laws, policies, and other structural and social barriers.

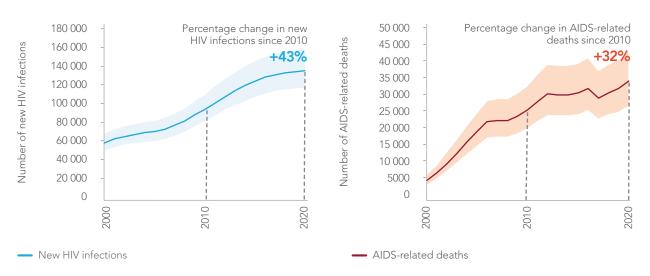

An HIV community centre in Moscow, Russian Federation, receives donations of hand sanitizer during the COVID-19 pandemic.

Sources: UNAIDS Global AIDS Monitoring, 2021 (https://aidsinfo.unaids.org/); Spectrum Demproj module, 2021.

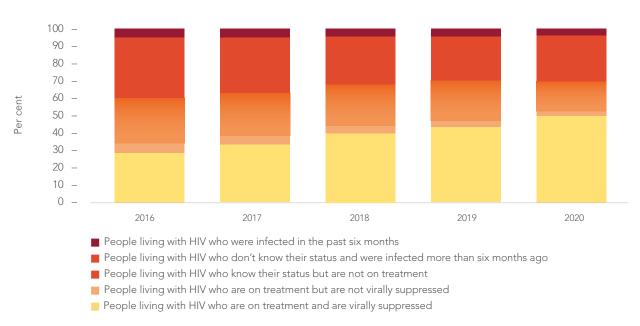

Note 1: Estimates shown are government-provided estimates reported for 2018–2020. Additional and alternative estimates may be available from different sources, including the Key Populations Atlas (https://kpatlas.unaids.org/), academic publications or institutional documents. Note 2: The reported values for gay men and other men who have sex with men are presented as a per cent of the adult population (aged 15–49 years) for consistency across key populations. The percentage of this population out of the adult male population (aged 15-49 years) will be approximately twice the values shown.

INVESTING TO END AIDS

The resources available for HIV responses in the region in 2020 were less than half (45%) of what is required to reach the region's resource targets for 2025. An average of US\$ 976 per person living with HIV was estimated to be available in 2020. A 2.2-fold increase in annual resources by 2025 is needed to expand HIV services sustainably and get on track to ending AIDS by 2030. The increase in needed resources is steeper in some countries in the region, which have lagged behind in specific areas of the response. In 2020, 90% of the total HIV resources were from domestic sources. There was a 46% growth in domestic resources between 2010 and 2020, with most of that growth happening between 2013 and 2018. It has since been followed by a flattening of HIV resources over the last few years. Given the current high HIV incidence rates (compared to 2025 targets), there is a need to bring down the unit prices of antiretroviral medicines and to strengthen spending on prevention programmes that are focused on key populations at higher risk of HIV infection.

Criminalization of transgender people

- Criminalized and/or prosecuted
- Neither criminalized nor prosecuted
- Data not available

Criminalization of sex work

- Any criminalization or punitive regulation of sex work
- Sex work is not subject to punitive regulations or is not criminalized
- Issue is determined/differs at the subnational level
- Data not available

Criminalization of same-sex sexual acts

- Death penalty
- Imprisonment (14 years–life, up to 14 years) or no penalty specified
- Laws penalizing same-sex sexual acts have been decriminalized or never existed, or no specific legislation
- Data not available

Law allows for possession of a certain limited amount of drugs for personal use

- No
- Yes
- Data not available

Parental consent for adolescents to access HIV testing

- Yes, for adolescents younger than 18
- Yes, for adolescents younger than 14 or 16
- Yes, for adolescents younger than 12
- No
- Data not available

Laws criminalizing the transmission of,

non-disclosure of or exposure to HIV transmission

- No, but prosecutions exist based on general criminal laws
- No
- Data not available

Laws or policies restricting the entry, stay and residence of people living with HIV

- Deport, prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Prohibit short and/or long stay and require HIV testing or disclosure for some permits
- Require HIV testing or disclosure for some permits
- No restrictions
- Data not available

Mandatory HIV testing for marriage, work or residence permits or for certain groups

- Yes
- No
- Data not available

Notes: A country is considered to have criminalized transgender persons if it uses the law to punish transgender individuals. Such a law may, for example, explicitly criminalize impersonation of the other gender, including cross-dressing. A country is considered to have any criminalization or punitive regulation of sex work if selling and/or buying sexual services is criminalized, ancillary activities associated with selling and/or buying sexual services are criminalized, profiting from organizing and/or managing sexual services is criminalized, and/or there are other punitive and/or administrative regulations of sex work.

WESTERN AND CENTRAL EUROPE AND NORTH AMERICA

s a region, western and central Europe and North America has achieved the 90–90–90 targets, and continuing declines in annual HIV infections and deaths suggest that most of the epidemics of the region are being controlled. However, these regional averages obscure differences, both among and within countries. In the United States of America, for example, 34.5% of people living with diagnosed HIV infection (aged 13 years and older) were not virally suppressed (1).

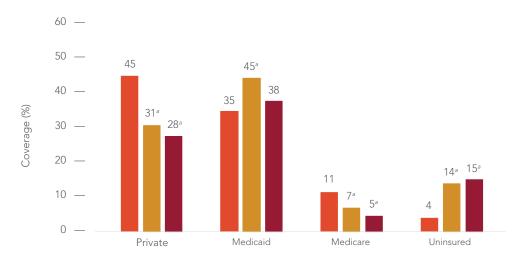

Service access in western and central Europe and North America tends to be lower among migrant populations and racial and ethnic minority groups. These disparities are linked to structural discrimination, administrative and linguistic barriers to accessing health insurance and services, and stigma at the community level. In the United States, for example, health insurance coverage is lower among people living with HIV in black and Hispanic communities, and people living with HIV who do not have health insurance are less likely to be virally suppressed than those with private or government-provided health insurance (2). People living with HIV who do not have health insurance in the United States, however, can access affordable HIV treatment through the Ryan White Comprehensive AIDS Resources Emergency (CARE) Act.

The increased provision of pre-exposure prophylaxis (PrEP) is contributing to reductions in the incidence of HIV infections in the United Kingdom of Great Britain and Northern Ireland and parts of the United States. Other proven prevention methods, such as harm reduction services, continue to hold the HIV epidemics in check in countries such as Italy, the Netherlands, Portugal, Spain and Switzerland, and they should be implemented more widely in countries where injecting drug use is a major driver of HIV and viral hepatitis infections.

PRIORITY ACTIONS FOR ENDING AIDS

- Improve testing strategies, including for viral load.
- Overcome stigma and discrimination in health-care settings, and integrate care for co-infections and comorbidities.
- Ensure that key populations, migrants and people in closed settings have access to HIV services, regardless of their legal or insurance status.
- Remove laws and policies that punish and discriminate against LGBTI communities, sex workers, people who use drugs, people living with HIV and migrants.
- Increase investments in HIV research, with particular attention to long-acting antiretrovirals, HIV vaccines and a cure.

Note 1: Estimates shown are government-provided estimates reported for 2018–2020. Additional and alternative estimates may be available from different sources, including the Key Populations Atlas (https://kpatlas.unaids.org/), academic publications or institutional documents. Note 2: The reported values for gay men and other men who have sex with men are presented as a per cent of the adult population (aged 15–49 years) for consistency across key populations. The percentage of this population out of the adult male population (aged 15-49 years) will be approximately twice the values shown.

CHANGE IN NEW HIV INFECTIONS BETWEEN 2010 AND 2020, WESTERN AND CENTRAL EUROPEAN COUNTRIES

	Estimates approved by country	Estimates not finalized by the time of publication
Countries with declines in new HIV infections of greater than 20%	Denmark Estonia Italy Netherlands Norway Portugal	Austria Belgium Switzerland United Kingdom of Great Britain and Northern Ireland
Countries with declines in HIV infections of 0% to less than 20%	Greece Spain	Finland Israel Lithuania
Countries with increasing new HIV infections	Ireland Serbia	Bulgaria Cyprus Czechia Hungary Latvia Poland Slovakia Sweden Turkey

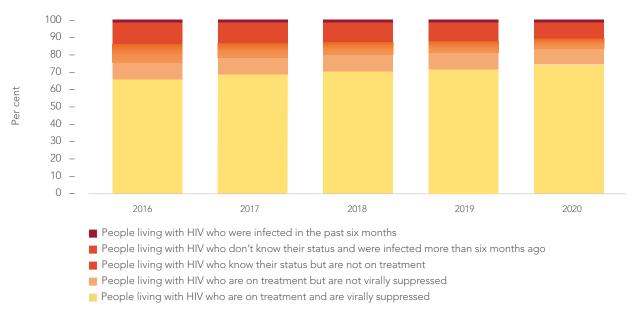

Source: UNAIDS epidemiological estimates 2021; European Centre for Disease Prevention and Control, WHO Regional Office for Europe. HIV/AIDS Surveillance in Europe 2020: 2019 data. Copenhagen: WHO Regional Office for Europe; 2020.

Notes: Countries were omitted if there was a discrepancy between the estimated number of new infections for 2010–2020 and new diagnoses for 2010–2019 (Croatia, France, Germany, and Romania). Countries with <50 new HIV infections were omitted.

In western and central Europe, 11 countries have seen HIV infections decline by more than 20% since 2010, and 16 countries experienced increases or had limited declines in new HIV infections. HIV responses in several countries within central Europe are being held back by limited political commitment, harassment and other rights violations against lesbian, gay, bisexual, transgender and intersex (LGBTI) people and other key populations, and by insufficient steps to reach key populations with evidence-informed combinations of HIV prevention, testing and treatment services.

ANNEX ON METHODS

METHODS FOR DERIVING UNAIDS HIV ESTIMATES

Introduction

UNAIDS annually provides revised global, regional and country-specific modelled estimates using the best available epidemiological and programmatic data to track the HIV epidemic. Modelled estimates are required because it is impossible to count the exact number of people living with HIV, people who are newly infected with HIV or people who have died from AIDS-related causes in any country: doing so would require regularly testing every person for HIV and investigating all deaths, which is logistically impossible and ethically problematic. Modelled estimates—and the lower and upper bounds around these estimates—provide a scientifically appropriate way of describing HIV epidemic levels and trends.

Partnerships in developing methods for UNAIDS estimates

Country teams use UNAIDS-supported software to develop estimates annually. The country teams are primarily comprised of monitoring and evaluation specialists, programme officers, epidemiologists, demographers and others from the national ministry of health, national AIDS bodies and technical partners.

The software used to produce the estimates is Spectrum (developed by Avenir Health), with additional models that interact with Spectrum to estimate HIV incidence. 1 The UNAIDS Reference Group on Estimates, Modelling and Projections provides technical guidance on the development of the HIV component of the software.²

A brief description of methods used by UNAIDS to create estimates³

For countries where HIV transmission is high enough to sustain an epidemic in the general population, available epidemiological data typically consist of HIV prevalence results from pregnant women attending antenatal clinics and from nationally representative populationbased surveys. Many countries have historically conducted HIV sentinel surveillance among women attending antenatal clinics, which requires collecting data from a selection of clinics for a few months every few years. More recently, a number of countries have stopped conducting sentinel surveillance among pregnant women and are now using the data from the routine HIV tests conducted when pregnant women attend antenatal clinics and are tested for HIV. These data avoid the need to conduct a separate surveillance effort, and they provide a complete set of data from all clinics across the country instead of samples from specific sites.

¹ More information on Avenir Health can be found at www.avenirhealth.org.

² For more on the UNAIDS Reference Group on Estimates, Modelling and Projections, please visit www.epidem.org.

³ A set of articles describing the methods is available in a 2019 supplement (Volume 33, Supplement 3) of the journal AIDS: https://journals.lww.com/aidsonline/toc/2019/12153. A supplement on the latest methods will be released in 2021from the Journal of the International AIDS Society.

The trends from pregnant women at antenatal clinics, whether done through surveillance or routine data, can be used to inform estimates of national prevalence trends, whereas data from population-based surveys—which are conducted less frequently but have broader geographical coverage and also include men—are more useful for informing estimates of national HIV prevalence levels. Data from these surveys also contribute to estimating age- and sex-specific HIV prevalence and incidence levels and trends. For a few countries in sub-Saharan Africa that have not conducted population-based surveys, HIV prevalence levels are adjusted based on comparisons of antenatal clinic surveillance and population-based survey data from other countries in the region. HIV prevalence trends and numbers of people on antiretroviral therapy are then used to derive an estimate of HIV incidence trends.

In the remaining countries, where HIV transmission occurs largely among key populations at higher risk of HIV and the epidemic can be described as low-level, the estimates are derived from either surveillance among key populations and the general, lowrisk population, or from HIV case reporting data, depending on which data are most reliable in a particular country. In countries with high-quality HIV surveillance data among key populations, the data from repeated HIV prevalence studies that are focused on key populations are used to derive national estimates and trends. Estimates of the size of key populations are increasingly derived empirically in each country; when studies are not available, they are derived based on regional values and consensus among experts. Other data sources—including HIV case reporting data, population-based surveys and surveillance among pregnant women—are used to estimate the HIV prevalence in the general, low-risk population. The HIV prevalence curves and numbers of people on antiretroviral therapy are then used to derive national HIV incidence trends.

For most countries in western and central Europe and North America—and many countries in Latin America, the Caribbean, and the Middle East and North Africa that have insufficient HIV surveillance or survey data, but that have robust disease reporting systems—HIV case reporting and AIDS-related mortality data from vital registration systems are used to inform trends and levels in national HIV prevalence and incidence. These methods also allow countries to take into account evidence of under-reporting or reporting delays in HIV case report data, as well as the misclassification of deaths from AIDS-related causes.

In all countries where UNAIDS supports the development of estimates, assumptions about the effectiveness of HIV programme scale-up and patterns of HIV transmission and disease progression are used to obtain age- and sexspecific estimates of people living with HIV, people newly infected with HIV, people dying from AIDS-related illness and other important indicators (including treatment programme coverage statistics). These assumptions are based on systematic literature reviews and analyses of raw study data by scientific experts. Demographic population data, including fertility estimates, are derived from the United Nations Population Division's World population prospects 2019 data files or recent census data.

Selected inputs into the model—including the number of people on antiretroviral therapy and the number of women accessing services to prevent the vertical transmission of HIV—are reviewed and validated in partnership with the United Nations Children's Fund (UNICEF), the World Health Organization (WHO), the United States President's Emergency Plan for AIDS Relief (PEPFAR) and its agencies, the Global Fund to Fight AIDS, Tuberculosis and Malaria (the Global Fund), and other partners.

Final country-submitted files containing the modelled outputs are reviewed at UNAIDS to ensure that the results are comparable across regions and countries, and over time.

In 2021, subnational estimates were created and used by 39 countries in sub-Saharan Africa. The methods for creating these subnational estimates are provided in Part 4 of this annex.

Uncertainty bounds around UNAIDS estimates

The estimation software calculates uncertainty bounds around each estimate. These bounds define the range within which the true value lies (if it can be measured). Narrow bounds indicate that an estimate is precise, while wide bounds indicate greater uncertainty regarding the estimate.

In countries using HIV surveillance data, the quantity and source of the available data partly determine the precision of the estimates: countries with more HIV surveillance data have smaller ranges than countries with less surveillance data or smaller sample sizes. Countries in which a national population-based survey has been conducted generally have smaller ranges around estimates than countries where such surveys have not been conducted. Countries producing subnational estimates at the provincial level have wider ranges. In countries using HIV case reporting and AIDSrelated mortality data, the number of years of data and the magnitude of the cases reported or AIDS-related deaths observed will contribute to determining the precision of the estimate.

The assumptions required to arrive at the estimate also contribute to the extent of the ranges around the estimates: in brief, the more assumptions, the wider the uncertainty range, since each assumption introduces additional uncertainties. For example, the ranges around the estimates of adult HIV prevalence are smaller than those around the estimates of HIV incidence among children, which require additional data on prevalence among pregnant women and the probability of mother-to-child HIV transmission that have their own additional uncertainty.

UNAIDS is confident that the actual numbers of people living with HIV, people who are newly infected with HIV or people who have died from AIDS-related causes lie within the reported ranges. Over time, more and better data from countries will steadily reduce uncertainty.

Improvements included in the 2021 **UNAIDS** estimates model

Country teams create new Spectrum files every year. The files may differ from one year to the next for two reasons. First, new surveillance and programme data are entered into the model: this can change HIV prevalence and incidence trends over time or antiretroviral therapy coverage rates, including for past years. Second, improvements are incorporated into the model based on the latest available science and statistical methods. which leads to the creation of more accurate trends in HIV incidence. Occasionally, countries will also change the incidence modeling option within Spectrum, based on improvements in the data available in the country.

Due to these improvements to the model and the addition of new data to create the estimates, the results from previous years cannot be compared with the results from this year. A full historical set of estimates are created each year, however, enabling a description of trends over time.

Between the 2020 and 2021 estimates, the following changes were applied to the model under the guidance of the UNAIDS Reference Group on Estimates, Modelling and Projections, and based on the latest scientific evidence.

Antiretroviral therapy data and COVID-19 disruptions

In the 2021 software, teams chose whether to enter antiretroviral therapy data for 2020 by year or by month. Entering data by month captures disruptions due to COVID-19 mitigation efforts. Countries were encouraged to enter "Loss to follow-up" data (that is, people living with HIV who are alive and who had been previously enrolled on antiretroviral therapy, but who were no longer retained in care) in order to avoid underestimating the disruption effects if numbers on antiretroviral therapy decrease but retention on treatment is assumed to be perfect.

Effect: Increased estimates of AIDS-related deaths due to antiretroviral therapy interruptions.

Adult natural history model

Using Population-based HIV Impact Assessment (PHIA) survey data on untreated people living with HIV, the UNAIDS Reference Group determined that Spectrum was overestimating CD4 cell counts among persons off of antiretroviral therapy. To adjust for this, several inputs were updated to better fit the PHIA data:

- The estimated distribution of CD4 cell counts at initial infection with HIV.
- Disease progression rates among people not on treatment.
- AIDS-related mortality rates off antiretroviral therapy.
- The relative weight that the model places on allocating antiretroviral therapy to people with lower CD4 cell counts or to anyone eligible for treatment, regardless of their CD4 count.

As a result of these changes, people living with HIV who were not receiving antiretroviral therapy reach low CD4 cell counts sooner but survive longer at low CD4 cell counts.

Effect: Increased estimates of AIDS-related deaths globally.

Sex ratio of incidence

Spectrum uses an incidence rate ratio to disaggregate adult incidence by sex. Most countries with generalized epidemics use a default pattern to describe the trend in this ratio, with higher incidence in women than men, and which is set at a fixed value from about 20 years into the epidemic onward.

A review of mechanistic HIV transmission models suggested that antiretroviral therapy and voluntary medical male circumcision (VMMC) scale-up may reduce incidence in men more than in women. To account for this, Spectrum now increases the female-to-male incidence ratio by 0.05 per year during 2010–2020.

Effect: This directly increases new infections among females (about 10%) and indirectly raises new infections and AIDS-related deaths overall (~1%) via more mother-to-child transmission and shifts in adult antiretroviral therapy coverage.

Reduction in transmission on antiretroviral therapy

Spectrum previously assumed that antiretroviral therapy reduces HIV incidence by 0.7% per percentage point increase in treatment coverage. This parameter value is now increased from 0.7% to 0.8% based on a review of recent HIV epidemic calibrations of mechanistic HIV transmission models and evidence from Universal Test and Treat trials.

Effect: HIV incidence will be lower as antiretroviral therapy coverage increases. The effect of this change may be larger in countries—and in years—without strong HIV prevalence data.

Treatment interruption

Previously in the model, people who interrupted antiretroviral therapy returned to their baseline CD4 count category when they dropped off treatment. Based on a review of treatment interruption literature, Spectrum now assumes that people are one CD4 category higher after treatment interruption than their pre-treatment category. This only applies to patients who were on antiretroviral therapy for more than 12 months before interruption.

Effect: The impact of this change will depend on whether the country team has entered loss to follow-up information. Countries that assume 100% annual retention will see no change. Countries that reported lower retention may see fewer deaths with this change compared to their 2020 estimates.

Paediatric mortality on antiretroviral therapy

Assumptions about mortality rates among children on antiretroviral therapy are based on data from the IeDEA network of treatment sites. A recent review of their data on mortality among children on treatment has provided updated data for sub-Saharan Africa, Latin America, the Caribbean and Asia and the Pacific. The analysis considers age, CD4 at initiation, duration on treatment and region. The updated analysis suggests that among children on antiretroviral therapy, mortality has decreased over time: a child on antiretroviral therapy in 2010 was more likely to die than a child on treatment in 2018. Mortality rates for a given CD4 count and duration of time on antiretroviral therapy are lower than in previous versions of Spectrum, but these lower rates are offset by higher relative mortality in earlier years compared to the 2020 Spectrum inputs.

Effect: Little change in paediatric HIV deaths.

Fertility among women living with HIV

Assumptions about how HIV impacts fertility have been updated. These updates reflect changes in the estimated CD4 levels of all women, based on the changes in the adult natural history model (discussed above). In addition to revised natural history assumptions, HIV-related fertility effect estimates have been updated to include new household survey data that have become available since the last analysis in 2018.

Effect: New child infections may increase, especially in countries without routine antenatal care testing data that are used to adjust HIV prevalence among pregnant women.

Breastfeeding practices

Spectrum's model of breastfeeding duration in sub-Saharan Africa has been updated with the addition of three new surveys. In addition, data from all PHIA surveys were removed, except for the 2015 surveys from Malawi, Zambia and Zimbabwe. The PHIA surveys conducted after these first three surveys underestimated breastfeeding duration due to a change in the questionnaire.

Effect: Small changes in new child infections overall, but some countries in eastern Africa may see estimates of new child infections increase by 10–15%.

Changes for countries that use case surveillance data in their models

There were two methodological changes in the Case Surveillance and Vital Registration model. The likelihood specification for the distribution of the number of new HIV infections and AIDS-related deaths was changed from an inverse gaussian to a gamma distribution.

Effect: Narrower uncertainty bounds.

The incidence rate ratios fitter has been adjusted to allow time-varying sex and age ratios. The incidence and the rate ratios are now estimated simultaneously.

Effect: The model will be more flexible, but fitting procedures will be slower when incidence rate ratio fitting is enabled.

Credit: UNAIDS

AIDS Epidemic Model

The AIDS Epidemic Model (AEM) is, among other things, a model that estimates trends in incidence in countries with high-quality data on key populations. While it has been used to calculate adult incidence that is subsequently used in Spectrum, it was not capturing some of the complex calculations (e.g., by age, sex and CD4 count stratum) taking place in Spectrum, resulting in inconsistencies. To bring the two models in line, seven important updates have been made to AEM:

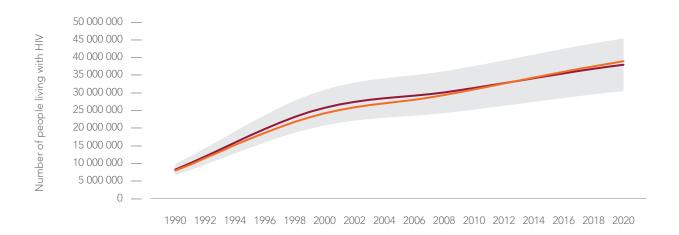

- Built in time-varying age, sex and CD4 mortality, progression and distribution by CD4 of new infections in order to align with Spectrum assumptions.
- Used the background all-cause mortality generated by Spectrum in AEM.
- Added other Spectrum changes in mortality to AEM code.

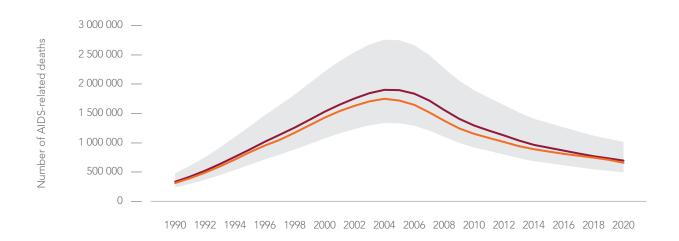

- Declining off-antiretroviral therapy mortality as antiretroviral therapy coverage increases.
- On-antiretroviral therapy mortality multipliers were added that reflect changes in the effectiveness of antiretroviral therapy over time.
- Antiretroviral therapy is allocated to people based on a weighted probability of death and eligibility for treatment.
- Refined AEM to do all mortality calculations by sex.

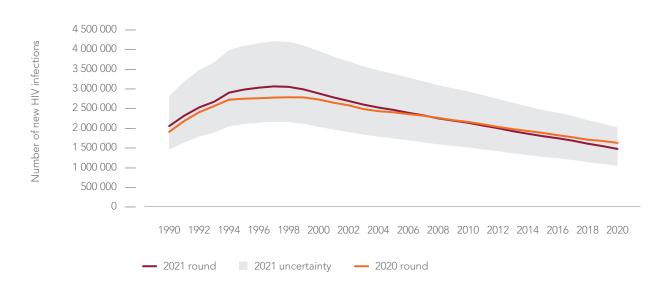

Effect: These modifications will eliminate the need to modify the assumptions and data in the Spectrum files to match AEM results.

Figure below presents the impact of all of the above changes on the estimates. At the global level, trends in new HIV infections, AIDS-related deaths and people living with HIV are similar to the 2020 round, although there are shifts within regions.

COMPARISON OF 2020 TO 2021 UNAIDS ESTIMATES: NEW HIV INFECTIONS, AIDS-RELATED DEATHS AND PEOPLE LIVING WITH HIV, GLOBAL, 2000–2019

Source: UNAIDS epidemiological estimates, 2020 and 2021.

Publication of country-specific estimates

UNAIDS aims to publish estimates for all countries with populations of 250 000 or more (according to the United Nations Population Division World population prospects 2019). For the countries with populations of 250 000 or more that did not submit estimates, UNAIDS developed estimates using the Spectrum software, based on published or otherwise available information. These estimates contributed to regional and global totals, but they were not published as country-specific estimates.

In countries with low-level epidemics, the number of pregnant women living with HIV is difficult to estimate. Many women living with HIV in these countries are sex workers or people who use drugs—or they are the sexual partners of people who use drugs or gay men and other men who have sex with men or sex workers—making them likely to have different fertility levels than the general population. UNAIDS does not present estimates of mother-to-child HIV transmission, including estimates related to children in some countries that have concentrated epidemics, unless adequate data are available to validate these estimates. UNAIDS also does not publish

estimates related to children for countries where the estimated number of pregnant women living with HIV is less than 50.

With regard to reporting incidence trends, if there are not enough historical data to state with confidence whether a decline in incidence has occurred, UNAIDS will only publish data for the most recent year. This is done to prevent users from making inaccurate inferences about trends. Specifically, incidence trends are not published if there are fewer than four data points for the key population, or if there have been no data for the past four years for countries using repeated survey or routine testing data. Trends prior to 2000 are not published for countries using case surveillance models if there are no early case surveillance or mortality data available.

Finally, UNAIDS does not publish country estimates when further data or analyses are needed to produce justifiable estimates. More information on the UNAIDS estimates and the individual Spectrum files for most countries can be found on the UNAIDS website (www.UNAIDS.org). Data from the estimates can be found in the AIDSinfo section of the UNAIDS website (http://aidsinfo.unaids.org).

METHODS FOR DERIVING THE 90-90-90 TARGETS

Introduction

Since 2015, UNAIDS has reported estimates of global, regional and country-specific progress against the 90-90-90 targets. Progress toward these targets is monitored using three basic indicators:

- Indicator 1 (the first 90): The percentage of people living with HIV who know their HIV status.
- Indicator 2 (the second 90): The percentage of people living with HIV who know their status and are accessing treatment.
- Indicator 3 (the third 90): The percentage of people living with HIV on treatment who have suppressed viral loads.

Indicators 2 and 3 can also be expressed as a percentage of all people living with HIV. When numbers or coverage of the treatment target are expressed relative to the total number of people living with HIV, this is called "the HIV testing and treatment cascade." Annual estimates of antiretroviral therapy coverage among people living with HIV are available from the time when treatment was first introduced in countries.

Data sources for constructing country measures

Country-level progress against the 90–90–90 targets was constructed using reported data from Spectrum and the Global AIDS Monitoring tool. Estimates are published for all people and separately for children (0 to 14 years) and adults (15 years and older, by sex). Upper and lower ranges of uncertainty for country-level estimates were calculated from the range of estimated numbers of people living with HIV. This range may not fully capture uncertainty in the reported estimates.

A description of the target-related indicators that countries report against is provided in the UNAIDS 2021 Global AIDS Monitoring guidelines (1). Data sources are also briefly described. A summary of the number of countries that are publicly reporting on each measure is provided in Table on the right, organized by region.

Source: UNAIDS epidemiological estimates, 2016–2021.

The final set of country measures of progress against the 90–90–90 targets for 2015 through 2020 are available at http://aidsinfo.unaids.org. Not all countries were able to report against all three prongs of the 90–90–90 targets: complete treatment cascades are published for 60 countries, the same as in the previous round.

Estimates of people living with HIV

All progress measures in this report are based on UNAIDS global, regional and country-specific modelled estimates from Spectrum of the numbers of people living with HIV. Estimates of people living with HIV are developed for all countries with populations above 250 000. More details about how UNAIDS derives estimates and uncertainty bounds around the number of people living with HIV can be found in Part 1 of this annex.

Estimates of people living with HIV in 2020 were available for 172 of 194 countries and territories, and they were published for 133. Published country estimates of people living with HIV (available at http://aidsinfo.unaids.org) represent 88% of the total global estimated number of people living with HIV in 2020.

Knowledge of HIV status among people living with HIV

Estimates of the number of people living with HIV who know their status were derived using the most recent HIV surveillance, programme data and nationally representative population-based survey data. Where data were available separately for children (aged 0 to 14 years) and adults (aged 15 years and older, by sex), the age- and sexspecific measures were first calculated and then aggregated to produce a national measure.

For countries outside of eastern and southern Africa and western and central Africa, published estimates of the number of people living with HIV who knew their HIV status are based on HIV surveillance case notification data, programme registers or modelled estimates derived from case surveillance data. If the estimate from these sources was lower than the number of people accessing antiretroviral therapy, the reported value was excluded. For countries using HIV surveillance or programme data, a country should have included this measure only if the HIV surveillance system had been functioning since at least 2015 and people who have died, emigrated or have otherwise been lost to follow-up are removed.

Although HIV surveillance systems, including those based on programme registers, can be

a reasonably robust source of data to estimate the number of people living with HIV who know their status, biases in the reported numbers may still exist. For example, a country's measure of the knowledge of status may be underestimated if not all people diagnosed are reported to the surveillance system in a timely manner. The measure also may be overestimated if people are reported to the system or included on a register more than once and these duplicates are not detected. Similarly, if people die or emigrate but are not removed from the system, the number of people living with HIV who are reported to know their HIV status also will be overstated.

For most countries in eastern and southern Africa and western and central Africa, estimates of the numbers of people living with HIV who knew their status were derived using Shiny90, a UNAIDS-supported mathematical model. This model uses population-based survey and HIV testing service programme data—together with country-specific HIV epidemic parameters from the standard UNAIDS Spectrum model—to produce outputs of knowledge of HIV status for adults, by sex. More details on the modelling approach are available elsewhere (2).

Knowledge of HIV status from the Shiny90 model for eastern and southern Africa and western and central Africa has a number of strengths compared with other approaches that rely directly on population survey data and programme treatment coverage data. Most importantly, the Shiny90 model uses population survey data to estimate the proportion of people living with HIV who report ever having an HIV test who are aware of their HIV status, and those who likely seroconverted after their last HIV-negative test. This distinction is informed by the national incidence trend calculated in Spectrum and is consistent with national published estimates of HIV prevalence and reported antiretroviral therapy coverage. The Shiny90 tool also uses assumptions from Spectrum and the population survey data to estimate knowledge of status by sex and age, assuming male-to-female testing ratios have remained relatively constant over time. Estimates of knowledge of status are also available since 2010.

An important model limitation, similar to other estimation approaches, is that caution should be

Credit: UNAIDS

used in interpreting results in instances when the last population-based survey was conducted more than five years ago, or if there are concerns about the accuracy of self-reported testing history in the survey (3). Countries can include HIV testing data from HIV programmes to improve trends in years where the population survey data are not available. Another limitation is that model results are only for those aged 15 years and older. UNAIDS continues to recommend that countries conservatively estimate knowledge of status among children as the proportion of children living with HIV on treatment (unless other information from case surveillance data are available).

People accessing antiretroviral therapy

Global and regional measures of antiretroviral therapy numbers are abstracted from country-reported programme data through the UNAIDS-supported Spectrum software and the Global AIDS Monitoring reporting tool. In the 2021 round, 148 countries publicly reported treatment numbers, and between 2015 and 2020, 150 countries had at least one publicly available estimate of the number of people on treatment (representing 95% of all

people on treatment). For the small number of countries where reported numbers of people on treatment are not available in selected years—primarily in western and central Europe and North America, and in Japan and the Republic of Korea—estimates of the number of people on treatment are developed either in consultation with the public health agency responsible for monitoring the national treatment programme or based on published and unpublished sources.

In partnership with UNICEF, WHO, PEPFAR and its agencies, the Global Fund, and other partners that support treatment service delivery in countries, UNAIDS annually reviews and validates treatment numbers that countries have reported to UNAIDS through Global AIDS Monitoring and Spectrum. UNAIDS staff also provide technical assistance and training to country public health and clinical officers to ensure the quality of the treatment data reported. Nevertheless, this measure may overestimate the number of people on treatment if people who transfer from one facility to another are reported by both facilities. Similarly, coverage may be overestimated if people who have died, disengaged from care or emigrated are not

identified and removed from treatment registries. Treatment numbers also may be underestimated if not all clinics report the numbers on treatment completely or in a timely manner.

Since early 2017, UNAIDS and other international partners have supported countries, primarily in sub-Saharan Africa, to verify that the number of people reported to be currently on treatment is accurate. This activity, however, has not been conducted during the COVID-19 pandemic.

People who have achieved viral suppression

Progress towards the viral suppression target among people on treatment and as a proportion of all people living with HIV was derived from data reported in Spectrum and through the online Global AIDS Monitoring reporting tool. For the purposes of reporting, the threshold for suppression is a viral load of less than 1000 copies per ml. Some countries may set lower thresholds or require persons to achieve an undetectable viral load, and where these lower thresholds are reported by a country, an estimate of the number of people who would have been suppressed at 1000 copies per ml is added to the number reported to be suppressed at the lower threshold. The Global AIDS Monitoring guidance describes this adjustment in more detail. This guidance also specifies that only a person's last test result from the reporting year should be submitted, so the reported number suppressed among those tested should represent people and not tests performed.4

The UNAIDS Global AIDS Monitoring guidelines were revised in 2019 to clarify that countries should report viral load suppression outcomes, regardless of testing coverage. However, viral load testing results will only be published in countries where access to testing is assessed to be nationally representative of all people on treatment (typically 50% or higher testing coverage). The Table above (page 453) shows the number of countries able to report on viral load suppression compared to previous years. For 2015, only 29 countries had reliable estimates; 107 countries were able to

report data for 2020. Some countries had lower viral load testing coverage for 2020 compared to 2019, presumably due to the COVID-19 pandemic and the related mitigation effects. In some countries, there is a longer than usual reporting delay on viral suppression tests.

For countries with nationally representative but not universal access to viral suppression testing, the estimate of viral suppression among those tested (i.e., the third 90) was multiplied by the number of people on treatment to obtain overall viral suppression levels in the country.

A number of challenges exist in using country-reported data to monitor the viral load suppression target. First, routine viral load testing may not be offered at all treatment facilities, and those facilities that do offer it may not be representative of the care available at facilities without viral load testing. Since it is not possible to know suppression in the untested population with certainty, we assume that the percentage of people suppressed among those accessing viral load testing is representative of all people on treatment.

Another challenge in measuring the accuracy of viral load suppression estimates is that UNAIDS guidance requests routine annual viral load testing results only for people who are on treatment and eligible for testing. If people newly initiated on treatment achieve viral suppression but have not yet been offered viral load testing, they will be incorrectly counted as not suppressed, and the resulting viral suppression estimate will be understated. UNAIDS also requests countries to only report results from routine viral load testing: if countries report test results primarily performed because of suspected treatment failure, the number of people virally suppressed in these countries will be underestimated. UNAIDS validates country submissions for quality, but it is not always possible to identify cases where both routine and other types of testing are occurring.

Finally, UNAIDS guidance recommends reporting viral load test results only for people

⁴ The 2020 UNAIDS guidance *Global AIDS Monitoring 2021: indicators for monitoring the 2016 Political Declaration on Ending AIDS* is available at https://www.unaids.org/sites/default/files/media_asset/global-aids-monitoring_en.pdf

on antiretroviral therapy; persons who are not on treatment and who naturally suppress the virus will not be included in this measure.

Methods for constructing the 90–90–90 treatment target at the regional and global levels

All programme data submitted to UNAIDS were validated by UNAIDS and its partners prior to publication. Country-submitted data that did not meet the required validation checks for quality, either at the indicator level or across the treatment cascade, were not included in the composite regional or global measures.

To estimate regional and global progress against the 90–90–90 targets, UNAIDS imputed missing country data for the first and third 90 targets using a Bayesian hierarchical model based on regional trends (or when regional trends are sparse, global trends), sex differences and country-specific data for those countries reporting data for some but not all years. The Bayesian model also provides uncertainty bounds. Estimates are available by sex for adults 15 years and older from 2015 to 2020. As in previous years, results of global and regional progress towards the 90–90–90 targets presented in this report supersede all previously published estimates. Additional details on the modelling approach are available elsewhere (4).

The proportion of estimates of knowledge of status and viral load suppression imputed by region from 2015 to 2020 in order to account for countries with missing data are shown in Table below. Due to large differences in the proportion of virally suppressed people in western and central Europe and the United States of America for the years in which data were available, subregional estimates were separately calculated for North America and western and central Europe, and then were combined to estimate the western and central Europe and North America regional results at large. Upper and lower ranges of uncertainty around the global and regional estimates of the HIV testing and treatment cascade are provided that reflect uncertainty in the number of people living with HIV and uncertainty (from missing country data) in the

number of people who know their HIV status and the number of people who are virally suppressed. Based on reports from data quality reviews through 2019, uncertainty from possible over-reporting or under-reporting of treatment numbers was added to the bounds of treatment coverage among people living with HIV and the second and third 90s. Upper and lower ranges of uncertainty for the 90s do not capture uncertainty in the reported or missing programme data on the numbers of people who know their HIV status or the number of people on treatment who are virally suppressed.

In this year's report, UNAIDS has used a new way of presenting the situation across the cascade in stacked bars. Out of the 100% of adult people living with HIV, the proportions under each of the following categories had been added in stacked bars:

- The lowest part are those who are virally suppressed on treatment.
- The next part are those who are not virally suppressed but are on treatment, calculated as the product of the number of people living with HIV and the difference between the proportion virally suppressed and proportion on treatment.
- The next part are those who know their status but are not on treatment, calculated as the product of the total number of people living with HIV and the difference between proportion knowing their status and those on treatment.
- At the top are those people living with HIV who have acquired the infection in the past six months, calculated as the number of new HIV infections among adults divided by two.
- The proportion immediately under it are those who have been infected for more than six months age and still not aware of their status. This proportion is calculated as the difference between people living with HIV who know their status, the product of the number of people living with HIV and one minus proportion knowing their status, and the number infected in the past six months.

PROPORTION OF IMPUTED DATA OF THE NUMBER OF PEOPLE LIVING WITH HIV WHO KNOW THEIR STATUS AND THE NUMBER OF PEOPLE LIVING WITH HIV ON TREATMENT WHO ARE VIRALLY **SUPPRESSED, 2015-2020**

		Asia and the Pacific	Caribbean	Eastern and southern Africa	Eastern Europe and central Asia	Latin America	Middle East and North Africa	Western and central Africa	Western and central Europe and North America	Global

Source: UNAIDS epidemiological estimates, 2016–2021.

One primary limitation that arises from incomplete availability of country estimates is that it is difficult to quantify the extent to which progress in countries that reported data to UNAIDS is similar to that of countries in the region that do not have data. This is particularly true for viral load suppression estimates, where reported data in some regions—especially in 2015 and 2016—are

limited. For example, viral load testing coverage in western and central Africa was especially low between 2015 and 2017, with most estimates derived from countries reporting data in 2018 and 2019. In Asia and the Pacific, national-level estimates of viral load suppression are not available in any year for India and not prior to 2018 for China.

DATA ON KEY POPULATIONS

Distribution of new HIV infections by subpopulation

The distribution of new HIV infections among subpopulations globally and by region was estimated based on data for 175 countries using four data sources.

The underlying number of new infections for each country is estimated with Spectrum. New infections among men and women aged 15 to 49 years are used.

For countries that model their HIV epidemic based on data from subpopulations, including key populations, the numbers of new infections were extracted from Spectrum 2020 files. This source provided data for sex workers from 51 countries, for people who inject drugs from 36 countries, for gay men and other men who have sex with men from 64 countries, and for transgender people from 25 countries (all of which were located in Latin America, the Caribbean, western and central Europe and North America, and Asia and the Pacific).

Incidence Pattern Model reports were available for 15 countries (Botswana, Cameroon, Eswatini, Ethiopia, Ghana, Haiti, Kenya, Lesotho, Malawi, Mozambique, Namibia, the United Republic of Tanzania, Uganda, Zambia and Zimbabwe) and provided information on distributions of new infections for their respective regions.

New HIV infections for western and central European countries were derived from the European Centre for Disease Prevention and Control (ECDC) and the WHO Regional Office for Europe HIV/AIDS surveillance in Europe 2020 (2019 data) report (5). The proportions of new diagnoses for each region in Europe (western, central and eastern) were applied to UNAIDS estimates of new infections in each country for people who inject drugs, gay men and other men who have sex with men, and transgender people. Data for sex workers

were not available from the ECDC report. New HIV infections in China, India, the Russian Federation and the United States were taken from the most recent available national reports of new diagnoses or other published sources.

New HIV infections among countries without a direct data source were calculated from regional benchmarks. The benchmarks were set by the median proportion of new infections in the specific subpopulation in all available countries in the same region. The majority of these countries were located in sub-Saharan Africa. There were 56 countries that used benchmark values for the sex worker estimate, 85 countries for the people who inject drugs estimate, 56 countries for the gay men and other men who have sex with men estimate, and 144 countries for the transgender people estimate.

New infections among sex partners of key populations were estimated using the number of sex partners and transmission probabilities from the literature. These include non-injecting sex partners of people who inject drugs, female sex partners of gay men and other men who have sex with men, spouses/steady sexual partners of sex workers, clients of sex workers and the spouses/steady sex partners of clients.

Quality of population size estimates

Population size estimates are used to calculate the relative risks presented in this report. The Global AIDS Monitoring system collects population size estimates. Some of the submitted size estimates are considered subnational, and UNAIDS uses regional medians of the population proportions of submitted size estimates to fill in missing information or extrapolate from subnational estimates.

The regional sections of this report include tables on the estimated size of key populations. These data are based on values reported through Global AIDS Monitoring in 2019, 2020 and 2021. A comprehensive review of the data was conducted during these reporting rounds, and estimates therefore should not be compared with data presented in previous UNAIDS reports. As a result of this process, the estimates reported can be categorized as follows:

- "National population size estimate" refers to estimates that are empirically derived using one of the following methods: multiplier, capture–recapture, mapping/enumeration, network scale-up method (NSUM) or population-based survey, or respondent-driven sampling-successive sampling (RDS-SS). Estimates had to be national or from a combination of multiple sites with a clear approach to extrapolating to a national estimate.
- "Local population size estimate" refers to estimates that are empirically derived using one of the previously mentioned methods, but only for a subnational group of sites that are insufficient for national extrapolation.
- "Insufficient data" refers either to estimates derived from expert opinions, Delphi, wisdom of crowds, programmatic results or registry, regional benchmarks or unknown methods, or estimates derived prior to 2016. Estimates may or may not be national.

SUBNATIONAL HIV ESTIMATES FOR SUB-SAHARAN AFRICA

Subnational HIV estimates were generated for 38 countries in sub-Saharan Africa and Haiti in the Caribbean using the Naomi model (Figure on page 18). The indicator displayed on page 18 is HIV incidence among females aged 15 to 24 years by subnational level.

estimation to jointly model uses small area estimation to jointly model HIV prevalence and people living with HIV, antiretroviral therapy coverage and HIV incidence. The model combines subnational-level data about multiple outcomes from several sources in a Bayesian statistical model. It uses national population-based survey data and antiretroviral therapy and antenatal clinic testing service provision data to provide robust indicators of subnational HIV burden. It provides estimates and uncertainty ranges for a number of indicators (including HIV prevalence, people living with HIV, antiretroviral therapy coverage, HIV incidence and new infections) by sex, five-year age groups and subnational level.

The model produces estimates at three time points: the year of the most recent population-based survey, the year of the last round of HIV national estimates (2020), and short-term, one-year projections for HIV programme planning purposes. Subnational population estimates by sex and age group are sourced from consensus sources in each country and adjusted to match the populations used within Spectrum by sex and age group.

Cross-sectional estimates for HIV prevalence, antiretroviral therapy coverage and HIV incidence are produced at the midpoint of the most recent nationally representative household survey. For HIV prevalence, the model is calibrated to survey data on HIV prevalence by subnational level, sex and five-year age group from the most recent population-based survey (Demographic and Health Survey or PHIA). Since the survey sample size in each subnational area is relatively small, routinely reported data about HIV prevalence among

pregnant women attending their first antenatal care visit, extracted from the national health information system, are used to improve estimates of the spatial pattern of HIV.

Antiretroviral therapy coverage by subnational area, age and sex is estimated from population-based survey data about the presence of antiretroviral biomarkers in HIV-positive survey respondents. Routinely reported antiretroviral therapy coverage among pregnant women prior to their first antenatal care visit is used as a covariate for the spatial pattern of antiretroviral therapy coverage. The antiretroviral therapy coverage and HIV prevalence are also calibrated so that the total number on antiretroviral therapy matches that report in the Spectrum national file.

A challenge for estimating treatment coverage for subnational areas is that persons may access antiretroviral therapy services in a different district than their residence (for instance, if facilities are closer or felt to provide better services). The model allows for a probability that resident people living with HIV access antiretroviral therapy in a neighbouring subnational area. The prior assumption is that the large majority of people living with HIV will access antiretroviral therapy in their area of residence, but this probability can vary based on subnational area data about the number of people receiving antiretroviral therapy compared to HIV prevalence, antiretroviral therapy coverage and population.

Direct estimates of HIV incidence are not available at the subnational level. While some recent household surveys have measured HIV incidence at the national level based on biomarker measures for recent HIV infections, too few recent infections are observed in any district to make a robust estimate. Therefore, to estimate HIV incidence at the subnational level, the HIV transmission rate from Spectrum estimates is calculated and applied to small area estimates of HIV prevalence and

antiretroviral therapy coverage in each subnational area. The sex and age distribution in each subnational area is based on HIV incidence rate ratios from Spectrum, applied to the population structure in each area.

The model projects from the most recent household survey to the current period by creating a one-step projection of the population to 2020. Population estimates are updated with official population estimates. The number of people living with HIV is projected forward based on survival estimates by province, sex and age group from Spectrum over the same period (which accounts for HIV disease progression and the effects of antiretroviral therapy scale-up on reducing AIDS mortality). Antiretroviral therapy coverage is updated based on the number on treatment in 2020 from service provision data.

The incidence rate among young women aged 15 to 24 years was calculated as follows:

New infections among females aged 15 to 24 years in 2020 / (population of females aged 15 to 24 years – HIV-positive females aged 15 to 24 years) in 2020 * 1000

LAWS AND POLICIES SCORECARDS

The regional laws and policies scorecards were constructed based on data reported by countries through the 2017, 2018, 2019, 2020 and 2021 National Commitments and Policy Instrument, a component of Global AIDS Monitoring (1).

Data submitted by countries through the National Commitments and Policy Instrument are reviewed by UNAIDS. During this review process, UNAIDS liaises with national Global AIDS Monitoring focal points to request clarification or to revise data submitted through the tool.

Data reported through the National Commitments and Policy Instrument have been complemented with data available from other sources, including global databases and primary sources.
